MACKENZIE VALLEY PIPELINE INQUIRY

IN THE MATTER OF AN APPLICATION BY CANADIAN ARCTIC GAS PIPELINE LIMITED FOR A RIGHT-OF-WAY THAT MIGHT BE GRANTED ACROSS CROWN LANDS WITHIN THE YUKON TERRITORY AND THE NORTHWEST TERRITORIES FOR THE PURPOSE OF THE PROPOSED MACKENZIE VALLEY PIPELINE

and

IN THE MATTER OF THE SOCIAL, ENVIRONMENTAL AND ECONOMIC IMPACT REGIONALLY OF THE CONSTRUCTION, OPERATION AND SUBSEQUENT ABANDONMENT OF THE ABOVE PROPOSED PIPELINE

(Before the Honourable Mr. Justice Berger, Commissioner)

Yellowknife, N.W.T.

May 16, 1975.

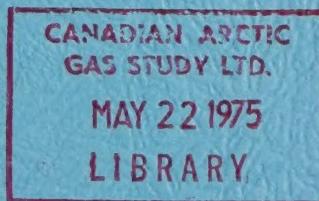

---

PROCEEDINGS AT INQUIRY

---

VOLUME 40

347  
M835  
Vol. 40

APPEARANCES:

Mr. Ian G. Scott, Q.C.  
 Mr. Stephen T. Goudge,  
 Mr. Alick Ryder and  
 Mr. Ian Roland for Mackenzie Valley  
 Pipeline Inquiry;

Mr. Pierre Genest, Q.C.  
 Mr. Jack Marshall,  
 Mr. Darryl Carter, and  
 Mr. John Steeves for Canadian Arctic Gas  
 Pipeline Limited;

Mr. Reginald Gibbs, Q.C.  
 Mr. Alan Hollingworth for Foothills Pipelines  
 Ltd.;

Mr. Russell Anthony,  
 Prof. Alastair Lucas for Canadian Arctic  
 Resources Committee;

Mr. Glen W. Bell and  
 Mr. Gerry Sutton for Northwest Territories  
 Indian Brotherhood and  
 Metis Association of the  
 Northwest Territories;

Mr. John U. Bayly for Inuit Tapirisat of  
 Canada and the  
 Committee for Original  
 Peoples' Entitlement;

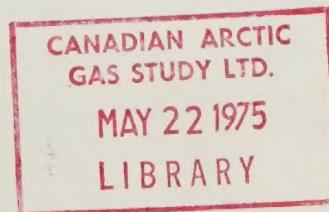

Mr. Ron Veale and  
 Mr. Allen Lueck for Yukon Native Brother-  
 hood;

Mr. Carson H. Templeton for Environment Protect-  
 ion Board;

Mr. David Reesor for Northwest Territories  
 Association of Muni-  
 cipalities

Mr. Murray Sigler for Northwest Territories  
 Chamber of Commerce

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

5 MR. MARSHALL: Mr.  
6

7 Commissioner, we're ready to begin this morning with  
8 the operations and maintenance panel. The members  
9 are Mr. Hurd, Mr. Fielder and Mr. Carlson. Perhaps  
10 Miss Hutchinson should swear them.  
11

12 DIRECT EXAMINATION BY MR. MARSHALL:  
13  
14 Q Mr. Commissioner, I'd  
15 like to proceed with the qualifications of the wit-  
16 nesses, starting with Mr. Lee Gordon Hurd, who is in  
17 the centre and is the chairman of the panel.  
18

19 Mr. Hurd, your present posi-  
20 tion is that of Director of Planning and Special Studies  
21 for Canadian Arctic Gas?  
22

23 WITNESS HURD: That is correct.  
24

25 Q Your educational back-  
26 ground is you have a degree from the University of  
27 Alberta, a Bachelor of Science in Chemical Engineering  
28 which you obtained in 1952.  
29

30 A Yes.  
31

32 Q Your professional  
33 affiliations, sir, are with the Association of  
34 Professional Engineers in Alberta; also you are a  
35 member of the British Columbia Association and the  
36 Yukon Territories Association of Professional Engineers.  
37

Fielder, Hurd, Carlson  
In Chief

1 A That's correct, yes.

2 Q Could you outline

3 briefly, sir, your professional experience beginning  
4 in 1952?

5 A Beginning in '52, Mr.  
6 Marshall, I was employed by a natural gas company  
7 operating in Central Alberta. The company owned and  
8 operated several gas wells and processing plants, and  
9 about 70 miles of gathering and transmission pipelines.

10 For three of the five years.

11 I was manager of the company, responsible for its  
12 ongoing construction programs and its operations.

13 Q And then, sir, from  
14 1957 through '59?

15 A During that time I/senior  
16 was  
17 design engineer with Westcoast Transmission Company  
18 Limited in British Columbia. That company at that time  
19 owned and operated about 1,000 miles of gathering  
20 transmission pipelines, including compressor stations  
21 and a processing plant. My responsibilities  
22 included the design of facility additions, construction  
23 management, and assisting with the development and  
24 implementation of the company's operating practices.

25 Q Then from 1960 to 1961,  
26 sir, you were a project engineer for Canadian Bechtel  
Limited?

27 A Yes.

28 Q What responsibilities  
29 did you have at that time, sir?

30 A My responsibilities were

Fielder, Hurd, Carlson  
In Chief

the design of the Alberta Gas Trunkline, Foothills  
Division, pipeline.

6 A Yes, that's right.

7 Q What responsibilities  
8 did you have with those organizations, sir?

18 Q And from 1970 to the  
19 present, sir, what positions have you held?

A I've been employed by  
Canadian Arctic Gas Study Limited, and one of the  
predecessor groups for that company, the Northwest  
Projects Group, for which I was the project manager.  
During this time I have been responsible for a variety  
of studies including overall project co-ordinating  
functions and preparing and co-ordinating the exhibit  
materials.

28 || Q Thank you, Mr. Hurd.

29 Next, Mr. Donald E. Fielder.  
30 Mr. Fielder, your present position is that of manager

Fielder, Hurd, Carlson  
In Chief

1 of operations and maintenance, Canadian Arctic Gas?  
2

3 WITNESS FIELDER: That's  
4 correct, Mr. Marshall.  
5

6 Q And your university  
7 background is that you have a degree from the  
8 University of Oklahoma obtained in 1957, Bachelor  
9 of Science in Mechanical Engineering.  
10

11 A Correct.  
12

13 Q You're a member of the  
14 Professional Association of Engineers, Geologists and  
15 Geophysicists of Alberta.  
16

17 A Yes sir.  
18

19 Q You are also a member  
20 of the Rules & By-Laws Committee of A.P.E.G.G.A.  
21

22 A Yes sir, that's the  
23 Association of Professional Engineers.  
24

25 Q I see, and you are a  
26 member of the C.S.A. Standard Z-184 Code Committee.  
27

28 A That was correct four  
29 days ago, sir. I am an ex-member of that Code  
30 Committee now, but still a member of the Transmission  
& Northern Sub-Committees mentioned below.

Q I'd like you to review  
briefly your professional experience, sir, beginning  
in 1957. You were with Robinson Machine & Supply  
Company Limited in Calgary.  
A Yes sir.

Q What responsibilities  
did you have there, sir?

Fielder, Hurd, Carlson  
In Chief

1                   A     Yes, sir, I was responsible  
2     for the design, construction and operation  
3     of company owned pipelines and stations and in that  
4     respect directed the activities of an engineering  
5     department in the areas of economic evaluation of  
6     pipeline systems, selection of pipeline routes,  
7     electrical, mechanical and civil, material  
8     selection, writing of contract specifications,  
9     contractor selection, material expediting and  
10    the co-ordination and supervision of construction  
11    activities until project completion and in addition  
12    was responsible for operational engineering problems.

13                  Q     Sir, in 1965 and to  
14    1971 you were with the Peace Pipeline Company Limited  
15    in Calgary?

16                  A     Yes, sir.

17                  Q     And as assistant  
18    chief engineer?

19                  A     Yes, sir.

20                  Q     Would you summarize  
21    briefly your responsibilities in that position,  
22    sir.

23                  A     I was responsible for  
24    the supervision of company and consulting engineering  
25    personnel for general pipeline and station engineering  
26    construction operation, for the preparation and  
27    specification and selection of computer based  
28    supervisory and data acquisition systems, for the  
29    design and construction of several remotely and  
30    locally controlled stations, for the co-ordination and

Fielder, Hurd, Carlson  
In Chief

1 installation of the communication system, and for  
2 a period of time served as field superintendent and  
3 also as chief dispatcher.

4 Q And from 1971 to the  
5 present, sir, you have been associated with this  
6 project and its predecessors?

7 A That is correct, Mr.  
8 Marshall.

9 Q What positions have  
10 you held, sir?

11 A I began with Gas  
12 Arctic Systems as a supervising engineer and sub-  
13 sequently with Canadian Arctic Gas Study Limited  
14 during which time I became manager of pipeline  
15 design and at the beginning of 1975 became manager  
16 of operation and maintenance.

17 Q What have your respon-  
18 sibilities included with the project, sir?

19 A Since 1971 I have  
20 had for Gas Arctic Systems and Canadian Arctic  
21 Gas Study Limited, responsibility for the development,  
22 implementation and monitoring of progress of  
23 various design, study and basic research programs  
24 carried out by consulting engineering personnel.

25 Emphasis in terms of both funds and effort expended  
26 has been in the field of geotechnical research  
27 activities relating to pipeline rights-of-way and station  
28 sites in permafrost terrain.

29 I was also responsible for supervision of operation  
30 of the Arctic Permafrost Research Test Facilities at

1 both Prudhoe Bay, Alaska and Norman Wells, Northwest  
2 Territories, for the collection of data and the  
3 development of plant operation and maintenance  
4 programs. I was responsible for the approval and  
5 progress monitoring of programs developed for  
6 analysis of Arctic test facility data; data collection  
7 and analysis included the impact of various  
8 construction techniques, design configurations,  
9 fluid temperatures and that sort of thing on  
10 permafrost terrain. The data collected therefore  
11 included meteorological, geothermal and geotechnical,  
12 the analysis however was carried out be assigned  
13 research scientists and consulting engineers.

14 I have also been responsible  
15 for project guidance with research scientists in the  
16 development of a pipeline project oriented geothermal  
17 analysis computer program for the establishment of  
18 the scope of thermal analysis studies required and  
19 for the review analysis reports submitted by  
20 geothermal analysis consulting personnel and  
21 currently as manager of operation and maintenance  
22 it is my responsibility along with Mr. Carlson to  
23 help set up the organization which will be  
24 charged with the operation of the Arctic Gas  
25 system.

26 Q Thank you, Mr.  
27 Fielder, now, Mr. Melvin E. Carlson, you are the  
28 Director of Operations and Maintenance for  
29 Canadian Arctic Gas?

30 WITNESS CARLSON:

Fielder, Hurd, Carlson  
In Chief

1 A That is correct.  
2 Q And you have a  
3 degree from the University of Alberta, Bachelor  
4 of Science in Electrical Engineering?

A Yes, sir.

Q And you are a member  
of the Engineering Institute of Canada and the  
Association of Professional Engineers for Ontario  
and Manitoba?

10 A that is right.

Q Sir, your professional  
experience, if I may summarize it, beginning in  
1952, and '53 you were with Perforating Guns of  
Canada Limited, Edmonton?

15 A Yes, sir.

Q Is that correct, and  
from 1953 to '56 were with Imperial Oil Limited  
in the Edmonton and Toronto offices working as  
an engineer?

A That is correct.

Q From 1956 through to  
1975 you have held a variety of positions with  
Trans Canada Pipelines Limited. is that correct?

24 A That is correct,  
25 " sir.

Q Beginning in 1956 and through  
'58 as an office engineer, beginning in '58 through '60  
as a senior engineer, from 1963 to 1964 as the  
senior engineer for construction services?

A That is right.

Fielder, Hurd, Carlson  
In Chief

1 Q 1964 through '68 a  
2 senior engineer in pipeline design?

3 A That is right.

4 Q 1968 to 1971 supervising  
5 engineer of pipeline design. 1971 to '72 assistant  
6 chief engineer pipeline division and operations?

7 A That's right.

1

Q      1972      to

2

'74, the manager of facilities operations. Perhaps,  
sir, at this point you could elaborate somewhat on  
your duties in that position as manager of facilities  
operation .

6

A      My duties and responsi-  
bilities in that position included the managing of  
the technical support staff devoted entirely to the  
field operation of the T.C.P.L., compressor station and  
pipeline facilities. These responsibilities included  
the following operations: The compressor section,  
communications and control section, performance analysis  
section, pipeline section, gas measurement, corrosion  
and the Trans-Canada test facility.

15

Q      Yes sir, then from 1974  
to just recently you were the manager of operations  
for Trans-Canada?

18

A      That's correct.

19

Q      What were your duties  
and responsibilities in that position, sir?

21

A      My additional duties  
included all facets of construction supervision,  
commissioning and start-up of new facilities, field  
operation and maintenance of the T.C.P.L. transmission  
system.

26

MR. MARSHALL:

Thank you, Mr. Carlson.

27

Sir, I'll file copies of the resumes for each of the  
witnesses with Miss Hutchinson, as well I'd like to  
file a list of the reports and studies upon which they  
rely, or to which they may refer.

Fielder, Hurd, Carlson  
In Chief

1 (OPERATIONS & MAINTENANCE PANEL WITNESSES

2 RESUMES MARKED EXHIBIT 122)

3 (LIST OF REPORTS & STUDIES ON WHICH O. & M.  
4 PANEL RELIES MARKED EXHIBIT 123)

5 MR. MARSHALL: Q Sir, as  
6 you're aware, Mr. Fielder was the representative of  
7 Arctic Gas who visited the Soviet Union and you had  
8 expressed interest in hearing of his trip. As Mr.  
9 Fielder is a member of the panel I thought it might  
10 be appropriate to have him deal with that first, and  
11 I'd like to proceed with that now before turning to  
12 the operations and maintenance testimony itself.

13 Mr. Fielder, have you had  
14 any recent exposure to Soviet pipeline design, con-  
15 struction and operating techniques with special  
16 emphasis on Arctic and permafrost problems?

17 WITNESS FIELDER: Yes sir.

18 During the period from November 19 through December 2,  
19 1974, I, accompanied by several other Canadians with  
20 varied interests, but generally pertaining to the gas  
21 industry, visited the Soviet Union. The visit was  
22 organized and sponsored by the Federal Department of  
23 Industry, Trade & Commerce, and formed part of the  
24 Canadian contribution to an organized exchange of  
25 technology relating to the gas industry.

26 You might also be interested  
27 to learn that during a subsequent and reciprocal visit  
28 I acted as host to a group of Soviet experts in  
29 Calgary on Friday, March 21 of 1975. During that  
30 meeting a member of Dr. Clark's staff described to the

Fielder, Hurd, Carlson  
In Chief

1                   Soviets the status of our research in the field of  
2                   frost heave, and we all answered many questions they  
3                   posed mostly related to foundation design in ice-  
4                   rich permafrost .

5                   During my visit to Russia,  
6                   meetings were held with various senior members of the  
7                   U.S.S.R. Gas Ministry and other associated Ministries  
8                   in Moscow, in Donetsk in the Ukraine -- that's  
9                   spelled D-O-N-E-T-S-K -- in Tuymen and Nadym in  
10                  Western and Northwestern Siberia. Tuymen is spelled,  
11                  T-U-Y-M-E-N and Nadym, N-A-D-Y-M.

12                  The purpose of the questions  
13                  posed by we Canadians was to determine the manner in  
14                  which the Soviets deal with problems relating to the  
15                  development of gas fields, i.e. the drilling, the  
16                  construction and operation of gas gathering systems,  
17                  and treatment plants, and the design, construction and  
18                  operation of gas pipelines and compressor stations,  
19                  all in areas of permafrost.

20                  Q      Why were you selected  
21                  to participate in this visit?

22                  A      At the time the selection  
23                  of Canadian delegates was made, I was manager of the  
24                  Pipeline Design Section of Arctic Gas. I was both  
25                  interested and had an obvious need to learn as much  
26                  as was possible respecting Soviet permafrost engineer-  
27                  ing as it applies to the design, construction and  
28                  operation of gas pipelines.

29                  Q      Would you tell us briefly  
30                  what you learned, Mr. Fielder?

Fielder, Hurd, Carlson  
In Chief

A      Unfortunately, not a  
1 great deal.   We were all very disappointed to learn  
2 after our arrival in Moscow that while the area we  
3 were to visit in the Soviet Arctic is described as an  
4 area of discontinuous permafrost, that most of the  
5 pipeline and all of the above ground facilities had  
6 been located deliberately in areas which contained  
7 little or no permafrost.   The area I refer to is the  
8 southern portion of the Medverzhye gas field, and  
9 that's spelled M-E-D-V-E-R-Z-H-Y-E, that's the  
0 Medverzhye gas field which is located in Northwestern  
1 Siberia approximately 1,200 km. or 746 miles north  
2 of the City of Tuymen, which is located in the  
3 Province of Tuymen.   It's also approximately 50  
4 km. or 31 miles from the Arctic Ocean.   The pipelines  
5 serving that area run generally south-west from the  
6 Medverzhye area to serve markets in the Urals and  
7 in Moscow, and they utilize both buried and grade  
8 or bermed construction techniques.

Q How was it possible for  
the Soviets to avoid permafrost terrain problems when  
locating their pipelines and above-ground facilities  
in an area of discontinuous permafrost?

1

A Avoidance of

2

permafrost areas along the pipeline route was  
accomplished by locating all of the facilities as  
much as was possible in river floodplains which  
do not contain permafrost. Between the river  
valleys the pipelines were located along relatively  
high ridges of well-drained permafrost. The  
area is predominantly sand which was, we are  
told, easily trenched and caused very few problems.

10

The area that we saw was

11

very old. Never, we were told, having been  
glaciated. The river valleys were very wide up  
to about 13 kilometers or about 8 miles with the  
wetted banks being only three to four meters  
or ten to thirteen feet in height. Secondary  
banks had very gentle slopes and the relief in  
the area appeared from the air to be less than  
30 meters or about 98 feet.

19

As I mentioned earlier the

20

soil was mostly sand and was well drained in the  
higher areas. Now, problems with the permafrost  
there were so minimal that the gas pipelines are  
operated at a temperature range of plus 3 to plus  
40 Celsius which is 37 to 104 degrees fahrenheit.

25

--As you can see, well above the melting temperature  
of ice.

27

Q Did you discover any-

28

thing relevant during your visits to design or  
research center in the Soviet Union?

30

A I visited both

1 design and research institutes in Moscow, Donetsk and  
2 in the City of Tuymen. It is very difficult  
3 to evaluate the usefulness of what we were told during  
4 our several visits. Firstly, with respect to design, we  
5 were shown, just for example, the manner in which buried  
6 and grade construction techniques are designed for perma-  
7 frost areas, but were not able to see those designs either  
8 being constructed or to be able to evaluate any operational  
9 problems which might have occurred as a result; we  
10 were told, however, that berms often had to be  
11 re-built annually and indeed we saw some of that  
12 work going on .

13 As far as research is concerned,  
14 we were told that a great deal of basic permafrost  
15 research is, and has been carried out but saw little  
16 evidence of the implementation of that research. I do  
17 not mean to imply that Soviet research programs are never  
18 translated into designs and construction techniques, be-  
19 cause if this were the case they would not have been  
20 able to carry out the very extensive development that  
21 they have of their northern resources. Obviously, a great  
22 deal of useful work has been done. Some of the members  
23 of Dr. Clark's panel, as was previously mentioned,  
24 attended the 2nd International Conference on Permafrost  
25 which was held in Yakutsk in June of 1973, and speak very  
26 highly of the amount and type of research which was carried  
27 out in the Soviet Union.

28 Q Are there other areas  
29 in the Soviet Union in which pipelines have been  
30 installed in Arctic areas containing permafrost which

Fielder, Hurd, Carlson  
In Chief

1 could be more useful from an educational  
2 point of view?

3 A There are two other  
4 pipelines which are located in the permafrost in the  
5 Soviet Union. ONE runs between Norilsk and  
6 Messoyakha and Norilsk is spelled N.O.R.I.L.S.K.  
7 and Messoyakha is spelled M.E.S.S.O.Y.A.K.H.A.  
8 It runs between Norilsk and Messoyakha and is constructed  
9 above ground on piles. The other is in the Yakutsk  
10 area and is partly on piles and partly buried. Two earlier  
11 Canadian delegations visited the Norilsk-Messoyakha line  
12 and perusal of their reports did not add a great deal to  
our  
13 / knowledge of permafrost pipeline techniques. The  
14 primary purpose of one of the groups was to note the en-  
15 vironmental after effects and according to the  
16 report they noted very little lasting environmental  
17 damage.

18 ANother clue that strengthens  
19 my impression that we will not likely learn a  
20 great deal more from additional visits to Russia,  
21 is that I discovered in my visits that the Soviets  
22 had not constructed any test sites prior to  
23 starting designs and construction and apparently  
24 now feel that test sites are required.  
25 I was questiones at length about what we had learned  
26 from our Arctic gas sites, how they were laid out,  
27 pipe sizes, fluid temperatures tested and measuring  
28 equipment utilized and that sort of thing. I was  
29 also asked to approve the training of a Soviet  
30 engineer or research scientist for a period of

Fielder, Hurd, Carlson  
In Chief

1       45 days at the Sans Sault Test Site. During the  
2 course of these discussions I learned that the  
3 Soviets now plan to construct two pipeline and  
4 several gas well test sites in the  
5 Medverzhye area of Siberia.

6                     During my meeting with the  
7 Soviet delegation in CALgary on March 21, I  
8 was able to confirm that the three systems that I described  
9 earlier are the only ones installed installed in  
10 the Soviet Union in permafrost and that no pipelines.  
11 have been buried there in ice rich permafrost. IN  
12 anticipation of having to do so they asked us  
13 many questions relating to our plans for foundation  
14 designs for heavy rotating machinery in areas  
15 containing ice-rich permafrost.

Fielder, Hurd, Carlson  
In Chief

11 Q In what manner do you  
12 think Arctic Gas and other interested Canadian groups  
13 can best keep abreast of and make use of the permafrost  
14 research carried out by the Soviets?

15                             A       By keeping abreast of  
16 developments as described in the literature. The  
17 National Research Council of Canada publishes trans-  
18 lations of such papers, and these are available at  
19 little cost.

MR. MARSHALL:

Thank you, Mr. Fielder.

21       Mr. Scott suggested that perhaps we just proceed  
22       with the O. & M. panel, sir, without having Mr.  
23       Fielder cross-examined separately at this time, if  
24       that meets with your approval I think we will just  
25       carry on.

26 MR. SCOTT: I raised at an  
27 earlier stage with Mr. Genest, I'm not sure whether  
28 it was formally at the hearing or informally, the  
29 question of providing to us a copy of Mr. Fielder's  
30 report to the Department of Industry, Trade & Commerce

Fielder, Hurd, Carlson  
In Chief

1 and the question of producing for us, with the co-  
2 operation of the government, the joint report of all  
3 participants on this trip which was compiled by  
4 the Department. I wonder if Mr. Marshall is able to  
5 tell us whether either of those things are possible,  
6 and what they have done about it. I understand he  
7 hasn't gotten them yet.

8 MR. MARSHALL: I believe the  
9 reports have been listed in the index and have been  
10 available in the library upstairs for some weeks.  
11 But I shall check that, Mr. Scott.

12 MR. SCOTT: Thank you.

13 THE COMMISSIONER: Well, before  
14 you proceed with the other members of the panel, let  
15 me just ask Mr. Fielder a few questions.

16 Q These three pipeline  
17 systems, Mr. Fielder, how long are they? What is the  
18 length of each pipeline system, do you know?

19 A Not in detail, sir.  
20 I don't have any information on the pipeline in the  
21 Yakutsk area at all. As far as I know, no reports  
22 are available, I haven't seen any. The Messoyakha-  
23 Norilsk pipeline, I think I can answer that very  
24 quickly here -- sir, I don't have the length of that.  
25 It's buried in this report somewhere, I can dig it  
26 out for you. One thing I could mention to you is that  
27 when they built it on piles, being concerned about  
28 the effects of temperature on the pipeline that was  
29 exposed and also in an attempt to avoid permafrost  
30 as much as possible, the line snaked around enough

Fielder, Hurd, Carlson  
In Chief

1       that it increased its length by approximately 13%  
2       over the straight line distance that could have been  
3       taken, had they decided to do so.

4                     Q      Do you know what the  
5       diameter of the pipeline was?

6                     A      The Messoyakha-Norilsk  
7       Pipelines, two of them now, and they're both 72 centi-  
8       meters or 28-inch, the lines that run from the  
9       Medverzhye field down through a place called Punga  
10      and eventually on into the Soviet grid system was  
11      48-inch, the initial diameter was 48-inch. It's  
12      since been partially looped at least once, and  
13      partially looped twice in places with 56-inch. I  
14      don't know the length of those lines either, sir,  
15      because the map we were given is written in Russian  
16      and as they use a different alphabet than us, it  
17      makes it very difficult to sort the thing out. But  
18      it's hundreds of miles.

19                    Q      Thank you. In the  
20      Soviet Union, as I understand it, the industrialized  
21      part of the country is in the west, in the sense that  
22      the industrialized part of our country is in the  
23      south, putting it very roughly.

24                    A      I think that's correct.

25                    Q      Are they transporting  
26      that gas merely to local centres in the vicinity of  
27      the Arctic Circle, comparable say to Yellowknife or  
28      Whitehorse, or even to Inuvik or smaller places than  
29      Yellowknife and Whitehorse, or did you say that they're  
30      tying it into some -- into their whole natural gas

Fielder, Hurd, Carlson  
In Chief

grid so that the gas winds up in the industrialized sector of the Soviet Union?

A The latter, sir. The connection to the Soviet grid system has certainly been made. I am not certain that gas from the North-western Arctic or Northwestern Siberia actually ends up at some of the industrial locations because in addition to their own uses they are exporting a great amount of natural gas to other countries in Europe, and it may well be that it goes there. But certainly it's tied in with the system.

Q You said that you were advised when you were there that -- you indicated that the conditions in which you found these pipelines were such that there wasn't a great deal that you could learn from the Soviet experience. You said they wanted to set up test facilities because they were going to undertake building pipelines in conditions similar to those of the Arctic Gas proposal here. Is that essentially what you meant?

A Yes sir. They were anticipating, as they expanded the Medverzhye field into the northern end of the field they would run into ice-rich permafrost and hence were concerned about what might happen when they install the warm gas pipelines that they seem to prefer, for reasons I don't understand.

Q We were told that one of the likely results of detente would be -- I shouldn't say "one of the likely results" but I think

Fielder, Hurd, Carlson  
In Chief

1 you will recollect that it was suggested that one  
2 of the possible results of detente might be to  
3 export natural gas from Siberia to the mainland, the  
4 lower 48 in North America. Was there -- were these  
5 new lines that were being discussed connected in  
6 any way with that proposal, or was that simply a  
7 proposal that no one indicated to you was being  
8 pursued?

9 A I know from a separate  
10 source that the proposal you mentioned is still being  
11 considered. But I understand that the gas location  
12 is somewhere in what I'd call Southeastern Siberia  
13 off to the East Coast somewhere north of Japan, and  
14 these are in areas of non-permafrost. As I understand  
15 it would be a liquification sort of a scheme. It  
16 had nothing to do with our trip, and many, many  
17 thousands of miles away.

18 Q And it wouldn't be  
19 brought -- it would be brought by -- liquified and  
20 brought by tanker then, presumably, if it were done.

21 A That's what I understand,  
22 sir, yes.

23 Q Well, thank you very  
24 I think  
25 much, Mr. Fielder. I wonder if you, since you will  
26 be obliged to return on Tuesday, if you wouldn't mind  
27 over the weekend, just as a favor to the rest of us,  
28 to draw a rough map -- I mean by hand, don't go  
29 to any trouble -- of the location of these gas lines  
30 in the Soviet Union so that we might have some idea  
of where the Medverzhye field is and so on and so

Fielder, Hurd, Carlson  
In Chief

1 forth if you don't mind?

2 A I'd be pleased to do so.

3 THE COMMISSIONER: Well, carry  
4 on, Mr. Marshall.

5 MR. MARSHALL: Thank you, sir.

6 Q Mr. Hurd, I understand  
7 that the substance of the testimony of your panel is  
8 contained in Section 13 B filed with the Inquiry as  
9 Exhibit 55, and in certain responses to the Pipeline  
10 Application Assessment Group questions which were  
11 also filed, specifically the question numbers were  
12 22, 54 and 55. Sir, would you highlight for us, please,  
13 the O.& M. plans described in those documents?

1

WITNESS HURD:

2

A Yes, Mr. Marshall.

3

First of all by way of introduction to Section  
13 B, that you referred to.

4

THE COMMISSIONER: Excuse me,  
forgive me, Mr. Hurd, are there canned notes on  
this?

5

MR. MARSHALL: Sir, we  
have distributed really what amounts to, I guess, a  
one page statement saying that, essentially  
he will just highlight it.

6

THE COMMISSIONER: All  
right.

7

MR. MARSHALL: Mr. Hurd has  
prepared from that a kind of a condensation  
of the materials in 13 B, being the points that he  
wants to highlight. We have not made copies of  
that. It is partly typed and partly on  
handwritten notes. It is really a condensation of  
materials that are there and you can follow really  
section 13 B, exhibit 55 -- Mr. Hurd will simply  
highlight that.

8

THE COMMISSIONER: All right,  
that is all that I wanted to know.

9

All right, 13 B.

10

MR. MARSHALL: Sir, if it will  
assist you, Mr. Fielder has a copy of it that he  
said you could follow along.

11

THE COMMISSIONER: Thank  
you.

1 MR. MARSHALL: Mr. Hurd?

2 A Thanks, Mr. Marshall.

3 By way of introduction to section 13 B which  
4 you referred to, that section sets forth the  
5 principles and the considerations which have guided  
6 our planning to date for the operation and maintenance  
7 of the proposed pipeline. In addition the present  
8 plans are described in order to allow a general  
9 evaluation of the likely manner and the effect  
10 of the operation of the pipeline.

11 Such plans have been based  
12 of course on our best present view of the  
13 facilities and the conditions which will likely  
14 be involved in the pipeline operations and of  
15 Government's and industry's standards. As detail  
16 design and on the ground surveys progress further  
17 and as construction is completed and as operations  
18 begin thereafter it will be necessary from time  
19 to time to make some modifications in the principles.  
20 As the operational stage approaches, a detailed operat--  
21 ions and maintenance procedures manual will be  
22 developed and issued for reference and observance  
23 by operating personnel.

24 The operations and maintenance  
25 planning has as a basic component the fact that the  
26 compressor stations are designed and will be constructed  
27 to remote-- to operate by remote control. Accordingly  
28 the O. & M. personnel and their permanent living  
29 accomodations will be concentrated at the operating  
30 bases with provision being made for living accomodation

at the compressor station sites for personnel  
who are required to be there for longer than one  
day. Compressor stations will be monitored and  
controlled by the gas control centre. The remote  
control function commands will adjust station set  
points and start or stop compressor units to  
maintain the required throughput of the pipeline.  
Compressor stations in regions of permafrost will  
include a propane refrigeration system that will  
control station discharge gas temperatures.

Mr. Marshall, the next  
section -- the next sub-section in Section 13 B  
is a glossary of terms and I propose that we  
do not spend any of that -- any time on that. I  
think those terms will become clear as we proceed  
through the balance of the testimony.

MR. MARSHALL: Fine, Mr.  
Hurd.

A To continue then with  
the -- and firstly with the operating and maintenance  
organization. For purposes of operation and  
administration, the pipeline has been divided  
into operating units described as divisions and  
districts. Within the divisions and districts  
manpower and equipment will be provided for the  
maintenance and operation of the pipeline. District  
work crews will maintain and operate the pipeline  
within their districts and be prepared to handle  
contingencies. The numbers and locations of personnel  
assigned to the various divisions and districts --  
a general description of the equipment to be provided

Fielder, Hurd, Carlson  
In Chief

for the districts and the divisions and the relationships of the operating and maintenance division and district organizations to the operations headquarters organization will be described in detail by Mr. Fielder who will use the projecting equipment there to show the tables and charts which follow Section 13 B. These will be shown just a little later.

MR. HOLLINGWORTH: Excuse me a moment, Mr. Hurd. I wonder if the reporter could turn up your microphone a bit, as I am having a little difficulty in hearing.

A Is that a little better?

MR. HOLLINGWORTH: That is better, fine.

A In recognition of the fact that the pipeline will form part of a total system to transport not only Canadian Gas but also gas from Prudhoe Bay Alaska, co-ordination with Alaskan Arctic Gas Pipeline Company will be accomplished through the applicant's operations and headquarters / gas control centre. The tables which Mr. Fielder will show indicate the current estimates of the number and locations of personnel required to operate and maintain the pipeline during each of the first five years of its operation. These figures anticipate that the build up of the facilities to a capacity of 4.5 billion cubic feet per day in the fifth year of operation. The figures given for the third through the fifth year

Fielder, Hurd, Carlson  
In CHief

1 of operation have been prepared on the same basis  
2 as the first two years and do not reflect the  
3 possibility of changes in such requirement resulting  
4 from the multi-discipline performance of personnel,  
5 changes in technology and experience gained in  
6 operations during the first years of operations.

7 The applicant plans to  
8 hire northern residents to fill its full time  
9 personnel requirements to the greatest extent  
10 possible. Important influences on these plans  
11 will be the success of recruitment and training  
12 programs designed to attract local residents, the  
13 productivity and turn over of personnel, the  
14 availability of contractor and suppliers personnel  
15 and the length of time required for individuals to  
16 become skilled in more than one basic technical  
17 discipline.

18 The estimated personnel  
19 requirements anticipate the achievement of pipeline  
20 industry standards of expertise and productivity  
21 by all of the applicant's employees. Specific work  
22 schedules for the applicant's employees will be  
23 based from time to time on the varying needs of the  
24 pipeline and on the relevant sociological and  
25 environmental considerations.

26 With the compressor stations  
27 and other sites being designed for remote operation  
28 employees involved in preventative maintenance and  
29 routine inspection programs will move between such  
30 locations on a planned basis.

Fielder, Hurd, Carlson  
In Chief

They may be required to return -- they may return to their operating base after a day's work, or maybe required to be away for several days at a time. The personnel requirement tables include sufficient manpower to permit two technical maintenance personnel to be present at each compressor station at all times during such period of time, after startup, as the applicant considers necessary to do regular maintenance work and to be available to analyze and remedy minor operating upsets.

The basic pattern is expected to be for employees to be permanently resident at the general location of their operating bases, with living accommodations at the compressor stations for any on-duty personnel required to stay overnight.

In addition to the recruiting of full-time personnel, we contemplate the part-time hiring of personnel from communities within the districts. In these cases the applicant would make any necessary arrangements to ensure that these personnel are transported to and from its operating bases, and are provided with any necessary living accommodation during the periods of such employment. It is expected that this part-time work will be part of the applicant's local hiring policy, providing a source of personnel who, where competent, will decide that they wish to fill vacancies in the applicant's full-time organization and who will have an opportunity to become qualified to do so through participating in

Fielder, Hurd, Carlson  
In Chief

1 the applicant's training programs and by on-the-job  
2 experience.

3 . Certain equipment and  
4 materials will be required by the operating pipeline  
5 company. I'd like to describe first the ground trans-  
6 portation and work equipment. The tables which Mr.  
7 Fielder will show a little later indicate our tenta-  
8 tive selection and locations for major items of  
9 ground transportation and work equipment. This selec-  
10 tion was made on the basis of the specifications of  
11 equipment currently available. In the ultimate selec-  
12 tion of equipment the applicant will take full advant-  
13 age of improvements in design and continuing obser-  
14 vations and evaluations of equipment employed on the  
15 construction of the pipeline.

16 On the basis of our present  
17 knowledge, we can describe firstly certain of the  
18 conventional equipment which will be required. Where  
19 the pipeline is accessible from all-weather roads,  
20 the transportation of operations and maintenance  
21 personnel and materials will be by conventional wheeled  
22 vehicles. Heavy equipment will be taken to point of  
23 use by trailer haul units. The types of conventional  
24 equipment to be employed will include firstly, personnel  
25 carriers, which will consist of light trucks with  
26 4-wheel drive providing capability for occasional  
27 travel along the right-of-way and a small complement  
28 of tracked personnel carriers for use in adverse winter  
29 snow conditions.

30 Secondly, work equipment, for

Fielder, Hurd, Carson  
In Chief

use in scheduled routine maintenance activities at compressor stations, meter stations, block valve locations and along the right-of-way. Types of work equipment are: Flat-deck winch trucks for general hauling of replacement parts, consumable supplies, etc. Flat-deck trucks with hydraulic cranes for loading and hauling. Dump trucks for hauling bulk materials. Wheel-type graders for road maintenance and snow ploughing. Wheeled-type tractors with front-end loader and backhoe attachments, and welding rig trucks.

Thirdly, heavy equipment which is used in major repair operations and includes side boom tractors for handling pipe and other heavy items, bulldozers for earth-moving operations, and track-mounted backhoes and draglines.

Lastly, transport equipment which is used for the road hauling of heavy equipment, pipe, valve assemblies, bulk liquids, etc. These are truck type tractor units with trailers.

Besides the conventional equipment, certain special equipment will be required to meet the conditions which are introduced by the lack of an access road network, the sensitivity of terrain and the extremes of climate. Although the applicant proposes to make use of aircraft for the transport of manpower and light equipment required in scheduled maintenance activities, there will be a requirement for surface transportation of heavy equipment for any major repair activity. The types of special equipment to be used will include personnel

Fielder, Hurd, Carlson  
In Chief

1        vehicles, which will most often be light-weight tracked  
2        vehicles with enclosed cabs to accommodate work  
3        crews, and transport equipment which will be special  
4        equipment designed to produce a low ground pressure  
5        by distributing its weight load over a large area of  
6        contact with the ground, and will be used for surface  
7        transport of heavy equipment and materials where  
8        required to protect sensitive terrain.

9                   Three main types of low  
10      ground pressure equipment will be employed.  
11      Firstly, track equipment providing low ground pressure  
12      in a variety of configurations and load ratings  
13      Secondly, balloon-tired equipment similarly providing  
14      low ground pressures.  
15      And finally, snow sleds employing large area runners  
16      to distribute the weight of heavy loads for hauls over  
17      winter snow and which can be towed.

18                   Low pressure transport units  
19      having load capacities in excess of 40 tons and fully  
20      loaded ground pressures of 4 pounds per square inch  
21      are currently available for commercial sources, and  
22      have been successfully used in the north. We plan to  
23      equip some low ground pressure units with attachments  
24      to permit their use in excavation operations.

25                   In addition, special purpose  
26      equipment will be provided at different locations. This  
27      special purpose equipment will include terrain protec-  
28      tion mats consisting of light-weight sections capable  
29      of distributing heavy loads over their whole area  
30      and which can be transported by air to a site -- a

Fielder, Hurd, Carlson  
In Chief

1 repair site for assembly into a work area on which  
2 equipment can be moved and operated with a minimum  
3 disturbance to the underlying terrain; and pontoon  
4 sets consisting of air transportable float and deck  
5 modules which can be assembled to provide temporary  
6 bridges over water crossings and an air-cushioned vehi-  
7 cle which we intend to have based at Inuvik to trans-  
8 port equipment and materials across water bodies  
9 during flooding.

10 Mr. Fielder will describe the  
11 special equipment I've referred to, using the projector  
12 a little later.

13 The need to use this equipment  
14 for right-of-way maintenance activity is expected to  
15 diminish significantly with the passage of time from  
16 startup. For example, heavy equipment for earth  
17 movement should be required in the right-of-way only  
18 after unusual developments such as an extremely heavy  
19 downpour which may have been so violent as to cause  
20 soil erosion at some point on the line. The need  
21 for major repairs to the line is expected to be so  
22 infrequent as not to be statistically noteworthy in  
23 estimating the frequencies of the movement of heavy  
24 equipment on the right-of-way.

25 Crossings of unfrozen rivers  
26 on the right-of-way will be made by amphibious  
27 equipment and bridges. After freezeup, snow roads  
28 and ice bridges can be developed, if necessary, for  
29 equipment used to transport required heavy machinery,  
30 fuel, gravel, and other supplies. In the sensitive

Fielder, Hurd, Carlson  
In Chief

1 terrain areas, use of the right-of-way for maintenance  
2 purposes will be largely by low ground pressure  
3 vehicles and will also be limited wherever possible  
4 to periods when the right-of-way is frozen. For  
5 maintenance which must be done at other times, aircraft  
6 will be the preferred method of transporting workmen  
7 and light equipment to the work sites.

8 Now I'd like to elaborate a  
9 little bit on air transportation. Our plan for the  
10 operation and maintenance of the pipeline contemplates  
11 the use of both fixed wing aircraft and helicopters  
12 for line patrol, and for the transport of personnel  
13 and materials from operating bases to compressor  
14 stations and other sites. The following are five  
15 types of aircraft which we presently consider will  
16 be used in our operations:

17 Type A is a fixed wing aircraft having a short takeoff  
18 and landing characteristics, a variable passenger/cargo  
19 capability of up to 18 to 20 passengers, or a 4,000  
20 pound load. Its principle function will be the  
21 transportation of materials and personnel from the  
22 operating bases to air strips in the vicinity of  
23 locations of maintenance activity.

24 Type B is a small fixed wing aircraft having a  
25 capacity for three passengers. Its specific function  
26 will be line patrol.

27 Type C is a large fixed wing cargo aircraft with a  
28 freight capacity of 45,000 pounds. Its principal func-  
29 tion will be the infrequent scheduled re-supply of  
30 bulk materials, the emergency transportation of

Fielder, Hurd, Carlson  
In Chief

machinery components and work equipment to major air strips in areas in which the pipeline is not accessible from all-weather road systems. This aircraft will be chartered when its use is required.

Type D is a passenger helicopter having a capacity for four passengers and a sling load capacity of approximately 1,200 pounds. Its principal function will be the transport of personnel, tools and supplies required in the maintenance of pipeline right-of-way and other sites. It will be owned by the applicant.

Type E is a cargo helicopter having a sling load capacity of 8,000 pounds, or in passenger configuration, a capacity for 26 passengers. Its principal use will be the transport of personnel, tools, equipment and supplies for operations and maintenance activities requiring capabilities beyond those of the Type D helicopter. One based in Inuvik will be owned by the applicant and used mainly in the northern section of the Northern Division. Occasional leasing of one in each of the Norman Wells and Fort Simpson Districts will be necessary from time to time.

All aircraft will be equipped to meet the requirements of the Ministry of Transport for operation under instrument flight rules. Air crews will be responsible to the relevant district superintendent for flight programming and supervision. For fixed wing aircraft we will have well-equipped aircraft landing strips at most compressor stations where such stations are not adjacent to all-weather roads. The helicopter offers a convenience that its

Fielder, Hurd, Carlson  
In Chief

1        loads can be placed anywhere along the right-of-way  
2        without the need of long air strips.

3                    All flights of the applicant's  
4        aircraft will be authorized only by senior district  
5        supervisory staff, who will schedule all routine  
6        maintenance work at the remote sites, and aircraft  
7        line patrols in such a manner that flights will be  
8        kept to a minimum. Such senior personnel would consult  
9        current data on wildlife conditions in the general  
10      area of the required flight in order to assist in the  
11      selection of a suitable type of aircraft and a flight  
12      path and altitude which will minimize the affects on  
13      wildlife.

14                  At this time it is difficult  
15      to provide an accurate estimate of the number of air  
16      patrols and maintenance flights which the applicant  
17      will require for its operation and maintenance purposes.  
18      We estimate that maintenance flights should normally  
19      require approximately one to three flights a week  
20      to each air strip. Line patrols will vary according  
21      to the season and terrain in the area of the line.  
22      Most sections of the right-of-way can normally be  
23      patrolled once or twice monthly. Other sections  
24      passing through terrain having a high frequency of  
25      cross-drainage or with slopes subject to excessive  
26      run-off will be patrolled more frequently and perhaps  
27      as often as weekly during the spring runoff period.  
28  
29  
30

Overflight of the right-of-way by aircraft taking maintenance personnel to compressor and meter sites can be used to augment the line patrol programs. The maintenance flights will be able to fly at altitudes in excess of 1,500 feet. Line patrol flights ideally should be at 100 to 150 feet above the right-of-way. During periods when flight at this altitude may disturb wildlife, the aircraft line patrol could be made at an altitude of 500 feet and a lower altitudes only when necessary to accurately define a condition on the right-of-way which appears suspect from the higher elevation.

With respect to aircraft related facilities at the planned district base locations, it is expected that hangar space and storage owned by others will be available for the applicant's aircraft. However, if sufficient accommodations are not likely to be provided by others, then hangars will be built by the applicant during the construction phase. Aircraft fuel storage will be provided at each compressor station air-strip and most helipads. Also a heated shelter which can be used by personnel in an emergency is planned at airstrips and helipads and a vehicle will be available for transportation of personnel from the landing strip to the compressor station.

In order that flights can be made to airstrips in severe weather conditions aircraft and airstrips will be equipped to

Fielder, Carlson, Hurd  
In Chief

1 instrument flight rule standards.

For warehousing and storage of spare parts, materials and supplies, main storage facilities will be located at each district headquarters with secondary facilities at compressor stations and other storage sites. A modular spare parts replacement system and a centralized shop servicing program will be established to minimize maintenance in the field. Wherever feasible we will make purchases from local suppliers, vendors and manufacturers and each district headquarters will receive, store and act as the distribution depot for most spare parts, materials and supplies that are required for the particular district operation.

Right-of-way storage sites for such things as gravel and line pipe will be established as required. The warehousing and storage of spare parts, materials and supplies will require four main types of facilities. Firstly, there will be indoor storage areas for such items as electrical and mechanical instruments, repair parts, cleaning supplies and paint and to provide shelter for work equipment.

Secondly, outdoor storage areas will be for the storage of large items, such as line pipe, large fittings, valves, pipe skids, and river and swamp weights. Granular backfill stockpiles will be established adjacent to each compressor station site and possibly at other locations.

Thirdly, fuel storage facilities

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Carlson, Hurd  
In Chief

which will be established at various locations along the pipeline. The fuel storage facilities in northern areas which are generally those areas in a sensitive terrain region, will vary in capacity depending on location and accessibility. Compressor stations which cannot be adequately serviced from commercial sources will have facilities to store sufficient fuel for up to one year of normal operations and for emergencies.

Fourthly, propane storage will be at compressor stations which require propane for gas chilling. With respect to deliveries of fuel to those locations and propane to those areas having all of which have all weather access highways, the storage tanks will be replenished as the need dictates keeping in mind that there should be sufficient supplies at each location to meet any emergency situations and to provide a reserve supply.

For fuel storage sites in sensitive terrain regions near the Mackenzie River or the Beaufort Sea, it is proposed that fuel will be barge transported during the summer months. Where the sites are not close to wharf facilities, the fuel and propane requirements will generally be barged transported to storage tanks at the wharf facilities to be stored until such time as conditions permit the transportation of fuel to those sites.

Finally, under the heading

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Hurd, Carlson  
In Chief

of equipment I would like to talk about fire,safety and survival equipment.

The safety of operations and maintenance personnel will be maximized by intensive training in the operation and use of all stationery and mobile facilities and by the provision of safety and emergency equipment. The applicant will , where conditions dictate, provide personnel with northern survival training, special cold weather clothing, communication facilities linked to the gas control centre, automatic radio locator equipment, food rations and emergency shelter. Where appropriate, all aircraft and ground vehicles will carry a full complement of survival equipement. Each compressor station will be equipped with a gas detection system, alarm system, fire detection system and automatic fire extinguishing system. Normal safety equipment such as first aid equipment, breathing apparatus and hand operated fire extinguishers will be located at strategic locations within each compressor station and communications site. Each district operations base will have equipment for evacuating injured or sick personnel from all points in the pipeline in its district. Where local firefighting and emergency equipment and forces are available, consideration will be given to having the applicant's support such facilities.

I mentioned earlier that Mr. Fielder, using the projector for charts and tables would describe in more detail the organizational

Fielder, Hurd, Carlson  
In Chief

1                   structure, the personnel and equipment we propose.

2                   I think, Mr. Marshall, that presentation might fit  
3                   in best just at this point.

4                   MR. MARSHALL: Thank you,  
5                   those are the charts and tables that are at the  
6                   back of 13 B?

7                   A      That is correct.

8                   MR. MARSHALL: Mr. Fielder.

9                   WITNESS FIELDER:

10                  A      As Mr. Hurd mentioned,  
11                  we thought it might be useful for clarity to stop  
12                  at this point and just briefly repeat some of the  
13                  things that he has already said but in a pictorial  
14                  fashion. This map shows the boundaries of the  
15                  divisions and districts         Mr. Hurd referred to.  
16                  The northern division is of course of most interest  
17                  to this inquiry and you will see that it has  
18                  been subdivided into three districts with headquarters  
19                  in Inuvik, in Norman Wells and in Fort Simpson.  
20                  The operations headquarters for the whole system is  
21                  planned to be in Calgary.

22                  This chart portrays the  
23                  manner in which the districts, down here the  
24                  divisions and operations headquarters are ranked,  
25                  Now, you will see that operations headquarters are  
26                  in the number one spot followed in the hierarchy  
27                  by divisions and districts.

28                  The personnel who work in  
29                  each division will be supervised by a division  
30

1 manager who in turn will report to the director  
2 of operations. Reporting to the manager of the  
3 northern division will be the administrative  
4 assistant who is responsible for personnel, public  
5 relations, safety and training programs and the  
6 clerical work required in the division.

7 Also reporting to the division manager is the  
8 division engineer who is responsible for the  
9 resolution of operating, technical, environmental,  
10 problems and the maintenance of lands and rights-  
11 of-way.

12 The superintendents of  
13 the three districts also report directly to the  
14 division manager.

15 The southern division  
16 is organized in the same manner but has only  
17 two districts.

18 This slide shows the manner  
19 in which the personnel in each district are  
20 organized. The district engineer, the clerical  
21 group and the aviation group all report directly  
22 to the superintendent in a support role. The  
23 Maintenance supervisor who is responsible for  
24 maintenance of the pipeline and right-of-way as  
25 well as some station and work and transportation  
26 equipment also reports directly to the superintendent  
27 as does the chief technician who has a staff of  
28 controls, communication, measurement, electrical  
29 and mechanical technicians to carry out station  
30 maintenance.

Fielder, Hurd, Carlson  
in Chief

This table,

212-D shows the anticipated personnel requirements for the Northern Division for the first five years of operation. You will note that 217 people -- that's 208 in the districts and 9 in the divisions -- will operate a total of 18 compressor stations and 1,314 miles of pipeline north of 60 degrees north latitude in Canada during years 4 and 5. The year designated one on this chart is the first year that gas flows through the pipeline system. It's our intention, however, to use the construction period as much as is possible as a training ground for permanent staff. Many of the people required to fill the O. & M. positions you see on this chart will therefore be hired up to three years prior to the year designated one.

During the period when the pipeline is not being constructed, in the summertime in the Arctic, for example, some of these trainees will be used to monitor the right-of-way on which line has already been constructed.

This table 212-E shows a comparable breakdown for the Southern division.

The following three tables 311-A, 311-B, and 311-C, provide a breakdown of the many types of ground transportation and work equipment which are expected to be required in the three northern districts in Canada. Much of this equipment will be surplus at the end of construction and will be over-hauled as required for use during the operation and maintenance phase. In the Inuvik District, please

Fielder, Hurd, Carlson  
In Chief

1 note that the equipment will be stored at each  
2 compressor station location shown across the top,  
3 whether or not this station has been constructed, so  
4 that the right-of-way is travelled as little as  
5 possible. Note also that L.G.P.s, standing for low  
6 ground pressure vehicles, and air-cushioned vehicles  
7 which we refer to as A.C.V.s are also listed. I  
8 plan to make a special presentation dealing with  
9 these types of equipment a little later.

10 Q Thank you, Mr. Fielder.  
11 Mr. Hurd, perhaps when we get the lights back on you  
12 could continue then with the description of the startup  
13 plan.

14 WITNESS HURD: Yes. Very  
15 briefly, Mr. Marshall, just to highlight the proposed  
16 pipeline and compressor station startup plan, the  
17 startup plan are the operations which could be used  
18 for taking the pipeline from the point of post  
19 construction to becoming a fully operating pipeline  
20 system. Prior to startup, operating and maintenance  
21 personnel will be thoroughly trained and familiarized  
22 with the operations procedures and with the equipment  
23 forming the pipeline. As sections of the pipeline  
24 are completed, continuous maintenance will be conducted  
25 as required. A written startup procedure will be  
26 prepared and provided to personnel for each facility  
27 before actual startup of that facility.

28 Now firstly, after satisfac-  
29 tory inspection of the line and calibration of the  
30 meter stations, and after receiving clearance from the

Fielder, Hurd, Carlson  
In Chief

1           gas control centre, the line will be purged of air  
2           by filling it with natural gas. In preparing the  
3           compressor station facilities for natural gas, the  
4           high pressure natural gas piping will be tested and  
5           the emergency shutdown controls and the leak detection  
6           systems will be activated. Any liquid or dirt drawn  
7           from the scrubbers and station header piping will be  
8           collected in a common blow-down tank to avoid any  
9           emission of material which might be harmful to the  
10          environment. When natural gas becomes available from  
11          the line, the compressor station purge has been com-  
12          pleted and an acceptance inspection has been made,  
13          operations personnel will carry out the pre-planned  
14          startup program to bring the compressor station into  
15          operation. The fuel system will be pressurized,  
16          turbine-driven generators will be activated, air  
17          compressors will be started, station raw water and  
18          treated water will be tested, and finally the com-  
19          pressor station units will be started up and all  
20          pressure, temperature, vibration, and speed signalling  
21          devices checked, and operating limits adjusted.

22           Technical personnel who will  
23          be at the compressor stations on a 24-hour basis until  
24          the applicant is satisfied that all station equipment  
25          is performing to specifications, will closely monitor  
26          the operating compressor stations after startup to  
27          ensure that any defects will be remedied expeditiously.

28           Next, to highlight briefly  
29          the routine operations and maintenance procedures.  
30          The proposed communications system will include

Fielder, Hurd, Carlson  
In Chief

1 equipment to monitor operating parameters, co-  
2 ordinate field operating and maintenance personnel  
3 and aircraft, co-ordinate gas quantity and quality  
4 demands, and provide information on local conditions  
5 along the pipeline. Maintenance of these systems  
6 will utilize modular unit replacement of defective  
7 parts in the field, with repairs to be carried out  
8 in the applicant's work shops or by the manufacturer  
9 or service organization.

10 The gas control centre will  
11 conduct flow studies to optimize the use of the  
12 pipeline and to ensure that gas quality standards are  
13 maintained, and will have a predominant role to play  
14 in the initiation of established emergency  
15 procedures when an emergency situation is communicated  
16 to it by its monitoring system.

17 The division headquarters will  
18 administer and co-ordinate matters concerning division  
19 personnel relations, employee safety training, public  
20 relations, engineering, and the environment maintenance.  
21 The preparation and implementation of contingency  
22 plans for line breaks, station outages and fires  
23 will be a combined effort of both the division and  
24 district headquarters. Each district headquarters  
25 will be the co-ordinating centre for all operations  
26 and maintenance activities within that district,  
27 including the inspection, maintenance and repair of  
28 the line, right-of-way, compressor stations, communica-  
29 tion sites, line valves, meter stations, river  
30 crossings, and erosion control facilities, the

Fielder, Hurd, Carlson  
In Chief

monitoring of Cathodic protection system, the maintenance of vehicles, roadways, wharves, air strips and equipment and the conducting of line patrols. A district maintenance shop will serve as the central maintenance depot and mobilization centre for district maintenance personnel and equipment. A typical district maintenance base will include a vehicle and heavy work equipment service area, an area for welding, a machine shop, a repair -- a mechanical repair shop, and facilities for electrical controls and communications equipment repairs and servicing.

With respect to compressor stations, under normal operating conditions the routine operating functions of starting, stopping, and controlling the output of compressor units and refrigeration equipment to maintain station throughput, plus the recording of operations data will be under the control of the remote command of the Gas Control Centre.

The physical functions of servicing compressor and refrigeration units and the auxilliary support systems will be performed by maintenance personnel during their routine visits to the stations. To accomplish this, maintenance programs will be initiated to schedule inspections and repairs of equipment and controls at regular intervals before deterioration of any individual unit or control sequence results in an emergency shutdown.

Further, predictive maintenance programs developed from trend analysis of the maintenance information system data, plus mechanical inspections,

Fielder, Hurd, Carlson  
In Chief

1 and gas turbine refrigeration equipment and compressor  
2 performance tests will permit the scheduling of  
3 maintenance inspections and programs to replace such  
4 things as bearings, and to clean fuel nozzles and  
5 compressor blades.

6 Technical specialists located  
7 in the applicant's operations' head office will be available  
8 to advise and assist on operations and maintenance  
9 problems, when necessary.

10 For repairs resulting from major  
11 breakdowns, modular spare kits -- spare parts kits  
12 will be available in the district operating bases.  
13 Such items as complete combustion liner kits, gas  
14 generator sections, and turbine rotors, will be  
15 replaced on site. Consumable spare parts and supplies  
16 that are used in routine maintenance will be stored  
17 at the stations.

18 With respect to right-of-way  
19 maintenance, the right-of-way varies topographically,  
20 environmentally and climatically, and maintenance  
21 procedures must be developed to meet local conditions  
22 in each district operating base. In the Norman Wells  
23 and Fort Simpson Districts, there will be considerable  
24 stretches of muskeg terrain and discontinuous permafrost.  
25 As the gas will be chilled in most of this area, any  
26 necessary excavation around the line will encounter  
27 frozen soil and special procedures will be required  
28 for any excavations.

29 The remainder of the pipeline  
30 in the Northern Division will carry chilled gas through

Fielder, Hurd, Carlson  
In Chief

1 sensitive terrain regions. These regions will require  
2 particularly careful techniques to promote successful  
3 re-vegetation after local maintenance and repair  
4 procedures. Gravel for any necessary backfilling  
5 of excavations will be stockpiled at intervals along  
6 the pipeline right-of-way. Surface access to points  
7 along the right-of-way in permafrost regions will be  
8 restricted during the summer months and therefore  
9 helicopter support will substitute for overland  
10 travel, wherever possible.

11 During the summer months  
12 overland movement with heavy maintenance equipment  
13 will be undertaken only if severe right-of-way damage  
14 is apparent, or if the security of the line is  
15 threatened and there is no other way to transport  
16 men and equipment to the point on the right-of-way  
17 where they are required.

18 Where corrective measures can  
19 be safely postponed, maintenance will be delayed until  
20 freezup. Where the line passes through drainage  
21 areas, instability of the surrounding terrain can be  
22 controlled by the use of pipe drains to remove excess  
23 water. Grouting will assist the sealing off of  
24 spring flows and sheath piling and rip-rap can strengthen  
25 unstable conditions. Unstable slopes which may  
26 develop on or close to the right-of-way will be  
27 monitored and checked regularly. Surface water which  
28 may flow across or down the ditch line will be con-  
29 trolled by terracing, gravel fill or re-vegetation.

30 The right-of-way will be

Fielder, Hurd, Carlson  
In Chief

seeded during the spring following construction. This will provide the initial plant cover on disturbed portions of the right-of-way, and also on borrow pits and haul roads. It will be necessary, however, to maintain close observation of the success of re-vegetation programs during the first summer, as the backfill crown settles and compacts, it may prove necessary to re-seed portions of the right-of-way during the fall of the first post-construction year. Fertilization will be required to obtain a suitable grass cover. The status of re-vegetated cover will be maintained by means of trained observers in the line patrol aircraft and large-scale aerial photographic sampling techniques. It may be necessary from time to time to make ground checks on areas suspected of a decrease in the plant cover to confirm the need for remedial measures.

The line patrol, as I mentioned earlier, will assist in the identification of unusual occurrences on or in the vicinity of the right-of-way, and will permit early repairs of any defects.

The conventional type of line patrol is by aircraft. Where there is a possibility of disturbing wildlife by aircraft patrols, the patrol program may be suspended -- may be supplemented by ground patrol carried out in a small vehicle suitable to the terrain of the particular right-of-way being patrolled, or on foot by at least two specially trained individuals.

Fielder, Hurd, Carlson  
In Chief

All patrols will be under the supervision of the district superintendent, who will ensure that the timing of the patrols reflects any known environmental facts peculiar to the area being patrolled.

Fielder, Hurd, Carlson  
In Chief

The ground patrols will include inspection of all above ground facilities on the right-of-way and river crossings, backfill on the line, monitoring systems, and drainage control measures.

The combined air and ground patrol on scheduled programs will facilitate the proper organization of maintenance work throughout the year so that ground transportation for maintenance purposes in areas of the pipeline will be kept to a minimum.

Access roads will be maintained regularly to insure that they will be capable of use when required. Airstrips and related equipment will be maintained in a serviceable condition throughout the year. Attention will be given to drainage measures to prevent any ponds of water from forming on or adjacent to the airstrips which may attract birds or result in soft spots or ice that would hinder aircraft operations.

To some extent, the pipeline company's equipment and manpower may be used in this work. But it is anticipated that much of such work will be contracted to local contracting companies where those services are available.

Mr. Marshall, one of the Pipeline Application Assessment Group requests for supplemental information dealt with monitoring and I would suggest that this would be the place to highlight our response to that question.

Fielder, Hurd, Carlson  
In CHief

MR. MARSHALE: Fine, that  
is question number 55, sir, in the exhibit 70.

A      Question 55 read and  
I will read through the question first.

"The applicant is requested to list and describe performance monitoring procedures that he would apply where necessary and particularly procedures for repetitive or instrumental measurement of such things as sediment concentrations in water, toxic materials, slope movement indicators, permafrost regression or build up, pore pressures, flow velocity in culverts, fish and benthos populations, mammal and bird populations, progress of vegetation growth and other parameters referred to in guidelines one to nine".

Our response, and I will summarize it very briefly, it is contained in the volume that has been circulated, I will summarize it very, very briefly, was performance monitoring will be carried out using three approaches. The first is the normal pipeline right-of-way and auxilliary facilities monitoring which is described in section 13 B -- which is usually done by aircraft but sometimes by walking the right-of-way.

The second technique involves the monitoring of known critical areas such as slopes and usually would require instrumentation to provide information on critical factors such as pore pressures in the case of slopes.

The third approach proposed

Fielder, Hurd, Carlson  
In Chief

in our response involves the highly detailed monitoring of changes in specific and carefully chosen areas where a great deal of data has been obtained on environmental factors, such as wild life, vegetation, water flows, etc. The results of this detailed monitoring will be extrapolated to similar areas along the pipeline.

The first type of monitoring, the line patrol has been used extensively in Canada. In areas where environmental disturbance could be caused by low flying aircraft, overflights will be timed so as to minimize impact.

The second type of monitoring involves a watch on such factors as slope stability, pipe movement, ground thermal regime, foundations and flow velocity in culverts.

To deal first with slope stability, long term instrument monitoring will be considered for all marginally stable slopes. The monitoring system will consist of instruments and markers which will be read periodically as part of the pipeline monitoring program. The principle instrument used to monitor the stability of slopes will be piezometers which will be installed in drill holes at the depths where changes in the pore water pressure would be of concern. Subsurface temperatures will be measured at critical points on the slopes using strings of thermistors, diodes or other temperature sensors installed in drill holes. Slope indicators will be used to measure downward

Fielder, Hurd, Carlson  
In Chief'

1 movement of slopes particularly where long  
2 term creep could disturb the integrity of the  
3 pipeline. Surface movement will be monitored by  
4 photogrammetric methods using aerial photographs of  
5 the slopes on which photo identifiable surface  
6 markers have been installed.

7 For pipe movement in  
8 previously identified critical areas the pipe conditions  
9 will be monitored regularly to provide early detection  
10 of any detrimental conditions of frost heave, buoyancy  
11 and settlements. The movement can be measured using  
12 marker rods. For ground thermal regime, ground temper-  
13 atures will be measured with strings of temperature  
14 sensors installed in intervals down a drill hole  
15 and read manually, automatically or remotely.  
16 At compressor stations all ground condition monitoring  
17 instruments will be read manually by operating  
18 personnel. Pipe movement, if any , and ground  
19 temperatures will be recorded.

20 For flow velocity in culverts  
21 the water velocity will be monitored where any  
22 potential for fish disturbance has been identified.  
23 A maximum head water level corresponding to the  
24 design flow for fish passage will be determined and  
25 actual post construction peak head water levels  
26 will be recorded periodically to insure that the  
27 design headwater load is not exceeded.

28 The third type of monitoring  
29 is well illustrated by the intensive work done at  
30 Chick Lake where we have conducted monitoring

Fielder, Hurd, Carlson  
In CHief

1 studies for the past two years. We plan to select  
2 futher sites when approval is granted and believe that  
3 government monitoring sites along the upper Mackenzie  
4 which may be created for monitoring the impact of  
5 the highway may also provide valuable information.  
6 The program at Chick Lake monitors vegetation, fish,  
7 both in Chick Lake and on the Donnelly River system,  
8 mammals and birds.

9 MR. MARSHALL: I take it,  
10 Mr. Hurd, that takes us to maintenance of measurement  
11 facilities?

12 A Yes, Mr. Marshall, that  
13 is correct.

14 To deal with that subject, a  
15 detailed maintenance and inspection program of the  
16 measurement equipment will be developed once the  
17 actual equipment has been finally selected/installed.  
18 A tentative program would include one, routine inspection  
19 of the major meter stations at the receiving and  
20 delivery points and of meters at compressor stations.  
21 Circular charts on meter recorders will change  
22 automatically each 24-hour period and will be  
23 collected and replaced weekly. Meters will be  
24 zeroed at receipt and delivery meter stations and  
25 will be calibrated monthly at major meter stations  
26 and semi-annually at compressor stations. Meter  
27 runs will be removed for inspection and gas quality  
28 sensing equipment will be inspected and calibrated  
29 as experience dictates.

30 To deal next with waste

Fielder, Hurd, Carlson  
In Chief

1       disposal. Maintenance personnel will regularly  
2       conduct tests of clear sewage effluent to insure  
3       compliance with Government water standards. The  
4       sludge removed in the biological sewage treatment  
5       process will be incinerated. Maintenance personnel  
6       working at compressor stations will be required  
7       to incinerate all combustible solid waste and  
8       bury all non-combustible waste in appropriate locations.  
9       The waste generated at district and division head-  
10      quarters and personnel housing will be generally  
11      domestic waste comprising combustible refuse from  
12      the offices and shops and the normal residential  
13      wastes of garbage and sewage. It is expected that such  
14      sewage treatment and waste disposal will be integrated  
15      with community facilities.

16    Finally, water treatment.  
17      A fresh water source for each compressor station will  
18      be located and developed during the construction  
19      phase of the system. Where necessary, the  
20      maintenance crew will haul water from a supply  
21      source in an insulated and heated water tank to  
22      refill storage tanks at the stations after treatment  
23      by portable water treatment units.

24    I would like to deal next  
25      with contingency planning and first with major  
26      pipeline repairs.

Fielder, Hurd, Carlson  
In Chief

## A part of contingency planning

must consist of pre-determined plans of action to be utilized in the unlikely event that a major pipeline break occurs. The following will describe in a general way the conditions and the considerations and the main courses of action which would be required in the case of a major pipeline break.

Firstly, no single emergency repair contingency plan can be developed for the entire pipeline because of the wide range of physical conditions encountered along the pipeline, and the seasonal variation of these conditions. Accordingly, specific contingency plans for shorter sections of the line will be prepared. Information compiled prior to and during construction will be available and will include final line route and profile, location of access roads to the right-of-way, location of facilities such as compressor stations, block valves, air strips, type of terrain and sub-surface soils, depth of cover, types of backfill material, and details of specific construction provisions, location and size of backfill material storage sites and borrow areas, hydrological data and the location of water bodies suitable for aircraft use, and reference data sheets specifying local environmental concerns and related protective measures.

Each sectional contingency plan will be in the form of standing orders listing the manpower, materials and equipment needed to affect a major line repair of various magnitudes and the

Fielder, Hurd, Carlson  
In Chief

1 sequential steps for their utilization.

2                          Recorded data peculiar to  
3 each sectional plan could include -- and the list is  
4 complete in Section 13 B, Mr. Marshall, I'll pick just  
5 a few examples from that list -- the location and  
6 content of the equipment storage depot nearest to the  
7 line section, the optimum routing and method of  
8 transportation of men and equipment from these  
9 depots to points on the line having regard to the  
10 different seasonal and environmental constraints,  
11 lists of the locations and quantities of pre-tested  
12 pipe lengths, heavy repair equipment units with loading  
13 and dispatch sequences for their transport  
14 by road haul units and/or low ground pressure units.

15                          To go on with the list, the  
16 list will include also lists of regional contractors  
17 outlining their capabilities and the possible assist-  
18 ance that they might be in line repair. Lists of  
19 regional agents of governmental bodies to be notified  
20 in emergency situations and identification of  
21 specific local human and environmental concerns and  
22 procedures for emergency use of land adjacent to the  
23 right-of-way. The transportation of men and equipment  
24 will be by existing all-weather roads to the extent  
25 possible, and to areas not so accessible by aircraft  
26 in order to cause the least disturbance to sensitive  
27 terrain. Emergency transportation in soft terrain  
28 situations could be affected in the following manner:  
29                          (a) with the exception of pipelayers, backhoes,  
30 dozers and replacement pipe, all of the equipment

Fielder, Hurd, Carlson  
In Chief

required in a major line repair operation can be transported by helicopters. The heaviest loads which cannot be transported by any type of helicopter available at the present time is the chassis of a pipelayer. The low ground pressure transport units proposed for the pipeline can haul the chassis of a pipelayer with the ancillary equipment being hauled by helicopter or other low ground pressure vehicle.

The air cushioned vehicle will be based in Inuvik and will be used where applicable in emergency situations within the Northern Division to transport heavy equipment over rivers in flood stage. A break consisting -- a break resulting in the escape of appreciable quantities of gas and its location will be detectible from changes in the data shown continuously at the Gas Control Centre. Upon such detection, the pertinent specific contingency plan will be implemented through a sequence of events which could be as follows:

- (a) First of all the stations will automatically shut down
  - (b) The Gas Control Centre will direct investigation personnel to the location of the break.
  - (c) The Gas Control Centre will then notify the manager of the relevant division, gas producers, users and shippers, and agencies of government
  - (d) The support supervisor will immediately dispatch the required -- the personnel required to load and transport materials and equipment to the repair site.

On arrival at the line break,

Fielder, Hurd, Carlson  
In Chief

1           the repair supervisor will report the location and  
2           the nature of the break, and the conditions at the  
3           site. The repair crew will then report on the extent  
4           of any gas flow from the break, ensure the closure of  
5           mainline block valves, open blow-down valves as required  
6           to hasten the depressurization of the damaged line  
7           segment, and lay out the repair site in anticipation  
8           of the arrival of repair equipment and materials.

9                         Then sufficient additional  
10          maintenance personnel will be dispatched to the desig-  
11          nated equipment depot to man the first 12-hour  
12          shift or repair operations. A second complete crew  
13          will be provided to permit repair operations to con-  
14          tinue on an around-the-clock basis until the repair  
15          is completed.

16                         The repair materials and  
17          equipment will be dispatched from the depot in a  
18          sequence related to the order of their required  
19          use at the repair site, beginning with terrain pro-  
20          tective mats, any necessary repair site camp equipment,  
21          including water supply and waste disposal units, and  
22          other helicopter transportable equipment indicated  
23          by the specific contingency plan.

24                         In the absence of suitable  
25          flying conditions, this equipment will be transported  
26          by the combination of road haul and low ground pressure  
27          vehicles over the routes indicated in the sectional  
28          contingency plan for the prevailing environmental  
29          conditions. The pre-tested replacement pipe sections  
30          and the heavy equipment required for excavation and

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Hurd, Carlson  
In Chief

1 take a break at this point. It's kind of a natural  
2 break in the presentation. Mr. Goudge has suggested  
3 that they are ready for coffee.

4 - THE COMMISSIONER: All right,  
5 we will break for coffee.

6 (PROCEEDINGS ADJOURNED FOR FEW MINUTES)

7 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

10 MR. MARSHALL: Mr. Commissioner,  
11 at the coffee break you expressed an interest in the  
12 reports that Mr. Fielder had referred to in connection  
13 with his Russian trip, and that Mr. Scott had made reference  
14 to. Mr. Fielder's report is entitled:

15 "A Report on Trip to U.S.S.R. of the Canadian  
16 Gas Working Group, November-December, 1974."  
17 We'll file a copy of that as an exhibit.

18 The other report which we have  
19 a copy of in the office upstairs, is entitled:

Fielder, Hurd, Carlson  
In Chief

1 "A Report on Trip to U.S.S.R. of a group of  
2 Canadian experts representing the Canadian  
3 Gas Drilling Production Processing and Pipe-  
4 lining Sub-Groups, November-December, 1974."

5 This is a draft report, it's prepared by the government,  
6 as I understand it, and very recently -- I think it  
7 was last week -- they got out the final version of  
8 the report. We can, if you like, obtain a copy of  
9 that and file it, if that's your wish.

10 THE COMMISSIONER: Would you,  
11 please?

12 MR. MARSHALL: In the mean-  
13 time --

14 MR. SCOTT: Will that be filed  
15 today, Mr. Marshall?

16 MR. MARSHALL: Mr. Fielder's  
17 report can be filed today; the other report is still  
18 in draft form, but if you'd like to have the draft  
19 filed, that can be done, I suppose. It might be  
20 better to have the final report, since we know it  
21 exists.

22 MR. SCOTT: It would be  
23 better to have a draft report soon than a final  
24 report later.

25 THE COMMISSIONER: Well,  
26 would you file Mr. Fielder's report and the draft,  
27 and then file the final report when it's available?

28 MR. MARSHALL: Yes, sir.

29 THE COMMISSIONER: Thanks  
30 very much.

Fielder, Hurd, Carlson  
In Chief

1 (MR. FIELDER'S REPORT ON VISIT TO U.S.S.R.

2 MARKED EXHIBIT 124)

3 (DRAFT REPORT OF GOVERNMENT OF CANADA ON

4 ABOVE VISIT MARKED EXHIBIT 125)

5 MR. MARSHALL: Mr. Hurd, if  
6 his description of the stirring of paint for the  
you would continue with coloring compressor stations,  
7 various hues and other such matters which seem to be  
8 of such interest this morning.

9 WITNESS HURD: Our plans to  
10 paint the stations, Mr. Marshall, are to use a color  
11 of paint to render them invisible.

12 (LAUGHTER)

13 Mr. Marshall, we had just  
14 dealt with the section in 13 B which was contingency  
15 planning, and that part of contingency planning which  
16 dealt with major line repairs. Two of the questions  
17 asked by the Pipeline Assessment Group relate to that  
18 subject, and it seems that this might be a good place  
19 to insert some highlights of our responses to those  
20 two questions.

21 Q Would you begin then,  
22 Mr. Hurd, with response to question No. 22,  
23 "Off-road vehicular traffic required for  
24 contingency repairs."

25 A Yes. That question  
26 was a series of questions. The first had to do with  
27 the frequency of pipeline ruptures. To highlight our  
28 response just very briefly, the statistics on the  
29 frequency of pipeline ruptures on some 13,000 miles  
30 of large diameter pipeline in the U.S., indicate an

Fielder, Hurd, Carlson  
In Chief

1 average of some .077 ruptures per 1,000 miles per  
2 year. On the basis of these data, the portion of  
3 the Arctic Gas pipeline located in the north might  
4 experience one break approximately every 10 1/2 years.

5 Reports obtained from three  
6 major Canadian gas transmission systems operating  
7 approximately 7,000 miles of 30-inch to 42-inch pipe-  
8 line for a period of 17 years yields statistics which  
9 indicate that the portion of the Arctic pipeline  
10 which lies within permafrost areas might experience .  
11 approximately one break every 9 1/2 years.

12 The above statistics, when  
13 applied to the applicant's proposed system, are believed  
14 to be conservative, particularly because of the fact  
15 that the most serious concern in the south-- that is  
16 damage by outside forces -- will be considerably  
17 less serious in the north due to the comparatively  
18 limited activity in this area by others.

19 The U.S. statistics indicated  
20 that the cause of approximately one-half of all  
21 reported ruptures has been outside force, and parti-  
22 cularly equipment operated by outside parties.  
23 In addition, material specifications for this  
24 system, are based on the highest standards yet  
25 developed in the industry. The risk of corrosion is  
26 much less in a refrigerated system installed in  
27 permafrost soils where liquid water cannot exist,  
28 either in the inside or the outside of the pipe while  
29 it continues to operate. Both these factors will  
30 reduce the likelihood of a failure in the main pipeline.

Fielder, Hurd, Carlson  
In Chief

1                   It is anticipated that these  
2 factors will tend to limit rupture incidents to perhaps  
3 one in 20 years.

4                   The question dealt with the  
5 seasonality of repair. To summarize very briefly,  
6 spring and summer seasons are the periods when  
7 damage probability will be the greatest, and repairs  
8 most difficult.

9                   THE COMMISSIONER: Excuse me,  
10 Mr. Hurd just stopping you for a minute. The life-  
11 time of this pipeline is 20 years.

12                  A       The financing assumes  
13 such a lifetime, yes. But it will operate much  
14 longer.

15                  Q       Yes, the proposal before us  
16 which we've discovered is subject to change.

17                  A       Yes.

18                  Q       Did you just say that  
19 the figures you've cited lead to the conclusion that  
20 you would expect then one rupture only in the lifetime  
21 of this pipeline?

22                  A       Within a 20-year period  
23 is our best judgment of how we should apply southern  
24 statistics to the portion of the pipeline in the  
25 north, yes sir.

26                  Q       From 60th Parallel  
27 north?

28                  A       Yes.

29                  Q       Fine. Go ahead then.

30                  A       We were talking about

Fielder, Hurd, Carlson  
In Chief

1 the seasonality of repair, and saying that the spring  
2 and summer seasons are the period when the probability  
3 is the highest. The company's mainline break repair  
4 plan would consider the types of terrain, the  
5 locations and the season in which the work must be  
6 done, in other words it will take into account the  
7 probabilities are highest in the spring and summer  
8 when repairs must be done during those seasons.

9                   The question then dealt with  
10 equipment required for repairs. The most serious  
11 risks to terrain would probably be encountered during  
12 the summer season when the active layer is at a  
13 maximum depth, and heavy rain may have made rivers  
14 and streams difficult to cross. To illustrate the  
15 quantity, type and use of repair equipment required,  
16 a difficult situation is described in the response to  
17 this question 22, and the use of the equipment which  
18 might be used is illustrated.

19                   The failure was assumed to  
20 be a break some 220 feet long at Milepost 250 on the  
21 Yukon coastal plain between compressor station sites  
22 CA-05 and CA-06. It is assumed to have happened in  
23 late summer following heavy rains when the Crow and  
24 Trail Rivers, but not the Firth River, are fordable  
25 with L.G.P. vehicles. The repair equipment would be  
26 an air cushioned vehicle with a load capacity of  
27 about 25 tons to assist in moving equipment and  
28 material across the Firth River. It would include  
29 several type D, and E, helicopters, to move -- which  
30 would move to the station site -- to the break site

Fielder, Hurd, Carlson  
In Chief

1 to transport personnel and small equipment. It would  
2 include an L.G.P. vehicle, backhoe and blade from  
3 station CA-05 and CA-06 which would proceed to the  
4 rupture site at the earliest opportunity, each loaded  
5 with terrain protective mats. The machines would be  
6 used to excavate around the ruptured section, to  
7 assist in lowering the replacement section of the  
8 line into the prepared ditch, and to backfill  
9 after completion of repairs.

10 Two side boom tractors would  
11 be required to place pipe in position for welding,  
12 and to assist in lowering the completed replacement  
13 section into the excavated ditch. These could both  
14 be hauled from one station if time permitted, or  
15 one from each of the stations. They would probably  
16 be transported on 40-ton L.G.P. vehicles. Again,  
17 transportation could be affected with the air cushion  
18 vehicle if circumstances required.

19 There would be an L.G.P.  
20 crane rated at some 20 tons, although possibly not  
21 essential this piece of equipment located at station  
22 CA-05 would probably be moved to the site to move  
23 pipe, welding machines, pumps, etc., and to assist  
24 in lowering in the completed repair section. It would  
25 require air cushioned vehicle assistance to cross  
26 the Firth River.

27 There would be a 40-ton  
28 L.G.P. vehicle to haul the two side boom tractors  
29 to the repair site and to haul in six 40-foot lengths  
30 of replacement pipe. There would be a 10-ton L.G.P.

Fielder, Hurd, Carlson  
In Chief

1 vehicle. Although these vehicles may not be required,  
2 but depending on the availability of helicopters,  
3 they could be used to transport small tools and  
4 equipment to the repair site. Not more than one  
5 trip each way would be anticipated.

6 There would be miscellaneous  
7 equipment including some portable camp equipment.  
8 The main personnel accommodation would be provided  
9 at station CA-05 and CA-06.

10 The heavy work equipment  
11 would be left on the site after completion of the  
12 repair and moved when winter conditions prevailed  
13 in order to ensure that damage to the vegetation  
14 layer was held to a minimum. The case selected and  
15 described is perhaps the most difficult repair  
16 situation on the proposed pipeline system, from the  
17 standpoint of damage to the terrain. For this  
18 reason, only the one case was described in the response  
19 to the question.

20 It's clear, of course, that  
21 the movement of heavy equipment to the site of repair  
22 work and the work at the repair site will damage the  
23 vegetation layer. We believe, however, that the  
24 surface restoration procedures are quite adequate  
25 to repair this type of disturbance in the same manner  
that services will be restored and revegetated  
following the initial construction of the pipeline.

28 The question asked also about  
29 engineering and other considerations involved in  
30 selecting equipment, and besides the obvious considera-

Fielder, Hurd, Carlson  
In Chief

tion of the ability of that equipment to do the work,  
briefly the response listed firstly that there should  
be minimum unit weight on the ground surface. We  
pointed out that we would propose to use aircraft as  
much as possible so as to minimize ground traffic  
over sensitive areas, and the answer pointed out also  
that the applicant would station certain types of  
heavy work and transport equipment at locations  
selected so as to avoid long hauls over sensitive  
terrain.

We pointed out also that a  
standard type of vehicle would be selected.

The question asked about the  
technical specifications for a series of L.G.P. vehicles.  
Mr. Marshall, there are several pages of technical  
specifications for L.G.P. vehicles included. I would  
propose that we should not read each of them into the  
record here, they are all included in the response to  
the question.

Q I think counsel would  
be eternally grateful if you would skip the detailed  
technical specifications. Mr. Fielder will be showing  
some photographs, I think, will he not?

A Yes, he will.

Q Of these types of  
equipment. Fine, Mr. Hurd, that deals with the  
response to question No. 22, does it?

A There is a tag end after  
that, Mr. Marshall, if you'd like me to cover that also.

Q Certainly.

A The question dealt finally  
with what they called the seasonality of vehicle movements.

Fielder, Hurd, Carlson  
In Chief

The response, our response to that question referred first of all to the response to subsection of this question 22, in which it was determined that the frequency of the need to make major repair-- pipeline repairs is very low, perhaps once in twenty years. The probability of its occurring at a location during a season in which critical environmental sensitivities would be a serious consideration, is of course very much lower.

In the event however, that major repairs are necessary at a location which is environmentally sensitive there are several measures which will minimize disturbance to birds, mammal and fish populations and which the pipeline company would propose to utilize. These measures would include -- would use air travel to and from the site by routes which as much as possible would avoid areas where disturbance might be caused.

Ground travel will be minimized by careful planning. Any repair work which can be delayed until after the sensitive season would be delayed.

Mr. Marshall, that completes question twenty-two.

MR. MARSHALL: The other question in the Assessment Group's Report which you wanted to deal with was number 54, "Contingency Plans for River Crossings". Perhaps I might just save your voice and read the question, Mr. Hurd.

A Fine.

**Q      The Applicant      is**

Fielder, Hurd, Carlson  
In Chief

1 requested to indicate the contingency procedures that he  
2 would use for repairs to the pipeline and major river  
3 crossing using that of the Peel River as an example.  
4 Included should be estimates of the amount of natural  
5 gas escaping before the affected pipeline length can be  
6 sealed off and the possible toxic effects of this leakage  
7 on aquatic organisms downstream for both summer and winter  
8 breaks and possible hazards involved.

12 A Yes, Mr. Marshall. The  
13 response points out first, that since the filing of the  
14 Applicant's -- of the application in March of '74, studies  
15 dual have shown that it is desirable to install pipelines at  
16 certain major river crossings. So that what we believed  
17 to be a very small risk before, is now even smaller.

However, to illustrate a repair procedure, the Great Bear River crossing was selected as an example. And the response concentrates on a major rupture which of course would be detected very quickly in the Great Bear River crossing.

23 MR. MARSHALL: Perhaps Mr.  
24 Hurd, I could interrupt you for a moment. You might just  
25 explain which would happen in the event that -- of a  
26 break in one of the crossings at a dual river crossing  
27 at this location? Mechanically, what would happen on the  
28 system? Just to complete the picture, as I take it the  
29 question really related to the plan as originally filed  
30 was contemplated only a single crossing.

A Yes, if a break occurred in one of the crossings at a dual crossing, that crossing section would be very quickly isolated by closing valves at either end of that section, and the gas flow would be diverted through the other section. That would require company a very short time and the pipeline/then would not be under the same pressure to make the repair at the time that it occurred necessarily. The crossing that failed could then be replaced at that time of year when conditions are most conducive to reconstruction of the pipeline.

MR. MARSHALL: Thank you.

Perhaps then you could go on to summarize the response to question 54?

A Fine. We had assumed for illustrative purposes a break in the Great Bear crossing which was a single crossing. The time of year in which a failure occurred would have some bearing on the method selected to/replacement. If, as an example a failure occurred in the early winter, consideration would be given to installing a temporary line on the ice to resume service while a permanent crossing replacement was being constructed.

Probably the most difficult season in which a failure could occur would be during the spring break-up. That example, is therefore selected for discussion during the balance of the response. The repair procedure would be first, to install a temporary smaller diameter heavy-walled pipe while the permanent replacement pipe is being constructed. The pipe and equipment would be transported from Norman Wells and

Fielder, Hurd, Carlson  
In Chief

1 adjacent compressor stations and a gravel pad would be  
2 constructed if it was necessary to provide a suitable  
3 work site on one or the other banks of the river.

30

A lesser amount of equipment would be moved to the south side. The pad would be constructed on the north side and the major equipment moved in there. A lesser amount of equipment would be moved to the south side of the river and would be used to assist in pulling the string of pipe across the river. The pipe would be selected so that it had a negative buoyancy of about 25%. Guyline cables would be connected from winch tractors to the pipeline in intervals during the pull operation to prevent the pipe from moving downstream with the strong currents. While the pipe was being prepared and pulled into place, valve manifolds would be fabricated. These following major pieces of equipment are estimated to be required. There would be two one and a half yard, cubic yard backhoes, four large side booms, eight large winch tractors complete with dozer blades, five large low ground pressure vehicles and a variety of other smaller equipment together with camp facilities.

After completion of temporary line and restoration of service, the construction of a permanent replacement line would begin as river conditions permitted. The construction procedures for the permanent line would be similar to those described in section 13 A 6.5.11 of the application. The design of the replacement line would be selected after detailed consideration of site and the cause of the failure. When the permanent replacement line

Fielder, Hurd, carlson  
In Chief

is completed the temporary line would be removed and the construction site restored.

MR. MARSHALL: Mr. Hurd,  
just to clarify a bit for me, is the plan as  
amended with the filing of the amendment dealing  
with the Fort Simpson revision and dual crossings,  
now envisioning a dual crossing of the Great Bear or  
still a single crossing such as you have been  
describing in this response?

A The plan as contemplated now, is still for a single crossing at the Great Bear River.

MR. MARSHALL: Could we move on then to a consideration of unscheduled major station repairs?

A Yes.

For unscheduled major station repairs, the lock out alarms and station emergency alarms would alert any on site personnel, the gas control centre, and the relevant district office that a complete compressor station or a major unit is shut down.

As in the case of a major line repair, there will be contingency plans developed for each compressor station. As all the compressor stations will be accessible by aircraft or highways and will have equipment and at sometimes manpower on site, equipment and manpower logistics will be simpler as they -- simpler than they would be in the case of a major line repair. We will insure that

Fielder, Hurd, Carlson  
In Chief

1        all critical spare parts are readily available so  
2        that turbine or compressor repairs will not be  
3        delayed. We will also develop a modular spare  
4        parts system so that the faulty part can be  
5        quickly replaced and returned to the company's  
6        or manufacturer's service centres for servicing.

7                      Finally, Mr. Marshall,  
8        Section 13 B covers fires and I would like to  
9        highlight that subsection.

10                  The company will comply  
11        with gas industry standards which have been  
12        developed to promote safe working practices and  
13        to establish emergency procedures in fire situations.  
14        These procedures include fire safety training, the  
15        use of non-sparking tools, the designation  
16        of restricted smoking areas, the granting of hot work  
17        permits for hazardous jobs and special procedures  
18        governing the operation, maintenance and refueling  
19        of heavy work equipment and the replenishment of  
20        fuel storage facilities.

21                  Equipment to be used to fight  
22        fires along the pipeline will be stored in suitable  
23        containers for ground transport or airlift by  
24        helicopter. Transportation of personnel and  
25        equipment to the site of a fire will be by the  
26        mode which will be appropriate to meet the type and  
27        location of the fire. Contingency plans for fire  
28        fighting will be developed. Following are the  
29        general principles which the company will utilize in  
30        establishing its fire procedures.

For compressor stations, each station will be fail safe with respect of fire and gas detection and fire extinguishment. A fire detection system will sense a fire in any of the main compressor station buildings by means of photo electric fire sensing eyes and heat rise detectors, and the emergency shut down system will be activated which will shut down the station and isolate the station from the rest of the pipeline at the same time an inert gas will be automatically discharged into the building where the fire is located, displacing the oxygen content and smothering the fire.

When a compressor station fire is extinguished the repairs will follow the relevant contingency plans for unscheduled station repairs described earlier.

For fire crossing or

initiating on the right-of-way, while they are on the right-of-way maintenance crews will be provided with portable fire extinguishing equipment. Even though it is extremely unlikely that a fire will even initiate much less get out of control around work areas on the right-of-way, we recognize that a fire caused by non-pipeline sources could cross the right-of-way before preventative measures can be taken and there is a possibility of soil instability developing in some areas because of the damage to the vegetation cover caused by fire. This damage would be corrected by the maintenance personnel.

1 as soon as practical after the fire has passed. The  
2 mobilization of men and equipment for right-of-  
3 way fires will parallel that for compressor  
4 station fires. Local fire officials will be notified  
5 and advised of the situation and liaison will be  
6 maintained with such officials for the duration  
7 of the danger.

8 For other forest or tundra  
9 fires, during the course of maintenance trips and  
10 line patrols along the pipeline, the operations and  
11 maintenance staff will look for grass, forest or  
12 tundra fires. When a fire is spotted, local  
13 government fire officials will be notified. Requested  
14 manpower and equipment which is not basic to the  
15 continuous safe operation of the pipeline will be  
16 made available to assist with the control of such  
17 fires. The fire officials will be kept fully informed  
18 of the applicant's equipment and manpower capabilities  
19 along the pipeline.

20 Following a fire, the  
21 company will use conventional means of restoring,  
22 the right-of-way in the non-sensitive terrain regions.  
23 In sensitive terrain regions the environmental impact  
24 caused by a fire will vary with the intensity of the  
25 burn. With a light fire likely to consume only  
26 the uppermost layer whereas a severe fire could  
27 destroy all the vegetation and humus cover.  
28 In the latter case, the burned area, unless promptly  
29 repaired, may be subjected to erosion and in  
30 regions of permafrost the possible degradation of

Fielder, Hurd, Carlson  
In Chief

1 permafrost resulting in surface recession. All  
2 areas so damaged which are significant to the  
3 integrity of the pipeline will be promptly restored.  
4 The restoration could follow several methods  
5 depending on the size of the area and the time of  
6 year. A temporary repair could involve the covering  
7 of the damaged area with insulated preformed blankets  
8 or a matt of straw which would be held in place  
9 by nylon or wire netting. The final permanent  
10 repair will involve revegetating the area.

11 Mr. Marshall, I mentioned  
12 earlier that Mr. Fielder would describe in some  
13 more detail and using the projector, the types  
14 of special L.G.P. vehicles which are now available.  
15 Mr. Fielder can make that presentation now if  
16 you like and that would end the direct testimony  
17 on O. and M.

18 MR. MARSHALL: thank you,  
19 Mr. Hurd, Mr. Fielder?

20 WITNESS FIELDER:

21 A Thank you. Mr. Marshall,  
22 before I go to the projector, I would like to mention  
23 that the reason for this presentation is because  
24 concern has been expressed on occasion that while the  
25 use of snow roads would satisfactorily protect the  
26 ground surface during the winter construction period,  
27 that the sensitive tundra surface could be damaged  
28 if it were travelled on during the summer months  
29 when the active layer is unfrozen, and in this  
30 respect I would like to make the following three

Fielder, Hurd, Carlson  
In Chief

1 points.

2 Firstly, that as the  
3 pipeline and right of way will be properly designed  
4 and constructed, and work on the right-of-way  
5 will be rigourously inspected during construction,  
6 the need to travel on the right-of-way during the summer  
7 months for maintenance purposes is expected to be  
8 very minimal.

9 Secondly , in order, however,  
10 to be prepared for the unlikely event that it proves  
11 necessary to travel on the right-of-way during that  
12 sensitive period, we plan to have suitable transportation  
13 equipment stratigically located for that purpose and  
14 you saw on the chart this morning that we would  
15 store them at various compressor station sites.

16 THirdly, the types of  
17 available and suitable transportation equipment  
18 which may be used to get to and to work at the location  
19 at which maintenance is required can be broadly  
20 grouped as follows: there would be aircraft which  
21 would include both fixed winged and helicopter, there  
22 would be watercraft which would include boats,  
23 hovercraft and A.C.V's or air cushion vehicles, and  
24 There would be land craft in which I would include  
25 L.G.P.s, low ground pressure vehicles and A.C.V.'s  
26 the air cushion vehicles, and I would like to  
27 emphasize that the types of equipment in all of  
28 these categories are available and they are in service  
29 today. I am :certain that everyone here today is  
30 familiar with both aircraft and boats so I will not

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Hurd, Carlson  
In Chief

bother with pictures of that -- of those, but  
as we are not familiar perhaps so much with  
L.G.P.s and A.C.V.'s I will show a few pictures of  
those.

Firstly, L.G.P.'s or  
low ground pressure vehicles. This vehicle is called  
a rologen and this particular one is currently being  
used as the photo shows in clean up operations on  
the Alaskan north slope during the summer months.  
They are available in a variety of sizes, but for  
illustration a typical rologen carrying a 20-ton  
payload exerts a pressure on the tundra of about  
4 pounds per square inch. Now, for comparison,  
a 180 pound man walking could exert a pressure of  
more than 6 and perhaps as high as 10 pounds  
per square inch.

Fielder, Hurd, Carlson  
In Chief

1                   These machines are also  
2 useful during the winter months. In this instance  
3 this rologon is traversing about six feet of powder  
4 snow in the Anaktuvak Pass in Alaska.

5                   THE COMMISSIONER: Excuse me,  
6 would you just go back to the last one, Mr. Fielder?  
7 Excuse me, I was writing down what you said and I  
8 missed it, what you said before, that is. What did  
9 you say about that? I'm sorry.

10                  A    That's a rologon and  
11 it's travelling in about six feet of powder snow in  
12 the Anaktuvak Pass in Alaska.

13                  Q    The depression it creates  
14 in the snow is two or three feet, is that --

15                  A    That's what it appeared  
16 on the photograph, sir. I didn't see it myself but it  
17 indicates and perhaps emphasizes what Mr. Williams  
18 said yesterday about the means of making snow roads,  
19 they use these machines to pack down snow.

20                  This particular photograph,  
21 which isn't very clear, shows a rologon --

22                  THE COMMISSIONER:  
                      Excuse me, can  
23 you gentlemen see these? No, they're shaking their  
24 heads, some of them. Would it help if these lights  
25 were out? Does anyone know where the switches are?

26                  MR. MARSHALL: If they like,  
27 there are some empty chairs over on this side of the  
28 room. You might be able to see it a little better  
29 if you moved up here.

30                  A    I'm sorry I'm unable to

Fielder, Hurd, Carson  
In Chief

1 move this machine, it works in one position only.  
2

3 This particular photo, although  
4 it's not very clear, shows a rologen towing a 100-ton  
5 non-self-propelled air cushioned vehicle on the  
6 Mackenzie River near Inuvik. I'll show you a much  
7 better picture in a few moments of what that air  
cushioned vehicle actually looks like.  
8

9 The foremost L.G.P. vehicle  
10 which is made in Calgary is shown in this photograph,  
11 is available with either tracks as shown, or with  
12 large balloon type rubber tires. The vehicle illus-  
13 trated is called a Husky 8, and exerts a 4.6 p.s.i.  
14 (pounds per square inch) pressure on the ground with  
15 a 40-ton pay load. I included this photograph just  
16 so that I could show one of a variety of configurations  
17 into which these sorts of vehicles have been rigged  
18 up. This particular one is equipped with a 195-foot  
19 high crane with a 35-foot jib, that's a horizontal  
20 piece that goes up from the crane (it's not in the  
21 photograph) and is being used to set electric power  
22 line towers. The point here is only that these  
23 L.G.P. and A.C.V. type vehicles can be equipped with  
24 cranes and hoists and hoes and a variety of other  
25 equipment, sort of things that we would need for  
26 working on the right-of-way during the summer months.  
27

28 These are photographs of  
29 air cushioned vehicles, and this is one I promised  
30 earlier to show you what it actually looks like, is  
being towed by the Husky 8 -- oh, excuse me, the  
rologen in the delta. This particular air cushioned

Fielder, Hurd, Carson  
In Chief

1        vehicle is not self-propelled, has a pay load of  
2        100 tons, and is made by Arctic Systems Limited in  
3        Edmonton. Now for those who are not familiar with  
4        these vehicles, a brief word on how they work.

5                   You will note that there is  
6        a large fan on each side of the vehicle. These fans  
7        take in air and move it down below the deck where  
8        the air is trapped between the deck surface, the sides,  
9        and the large balloon type skirts. This trapped  
10      air increases air pressure and lifts the vehicle  
11      approximately four feet off the ground with 100-ton  
12      pay load. That particular vehicle loaded would  
13      exert a pressure on the ground surface of about one  
14      pound per square inch. It is not self-propelled,  
15      as I mentioned.

16                  These non-self-propelled air  
17      cushioned vehicles can be towed by L.G.P. or low  
18      ground pressure vehicles, here you see a Foremost  
19      Delta 3 pulling the air cushioned vehicles.

20                  Actually I'm sure it's an advertising slide because  
21      no cloud of snow back there so it's obviously not in  
22      its working position. As I mentioned earlier, the  
23      Foremost vehicles were available both with track  
24      configurations and the balloon type tires, and this  
25      particular one has the tires.

26                  On rivers and across lakes they can  
27      be towed by boats. This is somewhere on the Mackenzie  
28      River, I don't have any idea where. It's difficult  
29      to see but there is a cable out here in front that's  
30      being towed by another boat on the river. There's

Fielder, Hurd, Carson  
In Chief

1 another cable out behind that's being held by another  
2 boat to stop it from fishtailing.

3 MR. CARTER: Mr. Commissioner,  
4 we should get a copy of this slide for Mr. Bayly to send  
5 to his client in Aklavik.

6 THE COMMISSIONER: Well, I  
7 missed that point.

8 non-  
A Some/self-propelled A.C.V.s  
9 winch themselves along a cable, should that be a  
10 decision made to do it that way. This particular non-  
11 self-propelled air cushioned vehicle is manufactured  
12 in Toronto. It is called a Hoverjack and as you can  
13 see here it's being towed by helicopter. An air  
14 cushioned vehicle very similar to this one with a  
15 25-ton pay load will soon be working in a peat  
16 mining operation in a peat bog near Delta, British  
17 Columbia.

18 Bell Aerospace Canada sells  
19 two self-propelled air cushioned vehicles called the  
20 Voyageur and the Viking. The largest, the Voyageur,  
21 the one with the red trim in the background, carries  
22 a pay load of up to 25 tons, or can carry about 30  
23 people comfortably at speeds up to about 50 miles per  
24 hour in calm water. Incidentally the Hoverjack that  
25 I showed you earlier with a 25-ton capacity, would  
26 exert a ground pressure of about one-half a pound  
27 per square inch on the ground.

28 Now, stream crossings pose  
29 special problems and they can be accomplished, however,  
30 in a variety of ways, boats, of course, with air cushioned

Fielder, Hurd, Carson  
In Chief

1        vehicles, but a rather unique and different manner  
2        is the use of this device called a flexifloat ferry.  
3        This ferry is furnished in separate modules which can  
4        be assembled on site, and you'll see that it would  
5        also be very useful for making portable or temporary  
6        wharves. Each of the rectangular sections that you  
7        see on here, here, here, whatever, is hauled in  
8        separately and bolted together, and this particular  
9        instance it's using a cable to winch itself across  
10      a river, it could be built with this configuration  
11      and anchored and of course be used as an off-loading  
12      site on the side of the river.

13                          This, once again, is called  
14      a flexifloat ferry.

15                          Another method of protecting  
16      terrain during sensitive periods of the year is  
17      illustrated in the next few photographs. You heard  
18      Mr. Hurd refer to terrain protective netting. This  
19      particular device is called Mo-Pad and it's furnished  
20      in 48 separate panels which can be separately carried  
21      to the site of a problem area and assembled to provide  
22      a working service which will protect the tundra by  
23      distributing the weight of the equipment over a much  
24      larger area.

25  
26  
27  
28  
29  
30

These two photographs show the MO-PAD being used in the Mackenzie Delta during August of 1972. And in the lower photograph, in this lower photograph you see the loader, that's a front-end loader carrying five and a half cubic yards of soil with approximately six and one half tons on each front wheel. You can see that it is deflecting the trackway somewhat, but not causing any deep ruts or anything like that.

This photograph shows a little more clearly, I think, the manner in which the MO-PAD sheets are inter-connected to form the sort of trackway, one would use to work from if they had to.

Now, this completes the photographic presentation, but I would like to say in conclusion, that we at Arctic Gas have not yet decided the specific pieces of equipment we plan to utilize during the operating phase, but I think it is pretty obvious that a large selection of proven equipment and material is available to us.

MR. MARSHALL: Thank you, Mr. Fielder, Mr. Hurd, and Mr. Carlson. Sir, that completes the direct evidence of the applicant pertaining to the operations and maintainence. I had indicated the other day that we would have available material pertaining to Mr. Horte's evidence. That has just reached me, sir, and I will hand it out to counsel when we disperse today.

MR. SCOTT: Mr. Commissioner, I am grateful for that. Some of the participants have indicated, as we have, our concern that the summaries are particularly this one are very late. Three days notice,

rather than the two weeks required. The difficulty in that, of course, is that it makes it extremely difficult to prepare any cross-examination before the summary is at hand. I would hope that in the future we won't have that problem as we have had in the past week or two.

THE COMMISSIONER: Well

Mr. Marshall explained the difficulty in preparing the summary of Mr. Horte's evidence yesterday, and I think it is <sup>a</sup>/perfectly adequate explanation. Matters keep coming up that are referred to Mr. Horte, so quite naturally his evidence -- the notes of his evidence can't be made available when subjects are still being added to the list which he has to deal with.

MR. SCOTT: I would have thought, sir, that in the future as Mr. Horte will be coming back, it would be helpful if that is the process that my friend goes through, he should let us have the sections of Mr. Horte's evidence as they become available. Presumably the evidence he will give with respect to what has been said by the geotechnical panel has now been fixed for several weeks, and I would hope that if we can't have it all at once, we could at least have it in sections so that we will have some idea of what we are going to confront.

MR. COMMISSIONER: Right, well you'll have the weekend to work on this Mr. Scott, since it's being made available now.

Was that report of -- Mr. Fielder, your report that you read this morning on your trip to Russia, was that a summary of the report that

Fielder, Hurd, Carlson  
In Chief

1 has now been marked as an exhibit?

2 WITNESS FIELDER: No, sir,

3 it was not.

4 THE COMMISSIONER: Was that  
5 report that you read this morning, was that marked as  
6 an exhibit?

7 MR. SCOTT: Yes, it was. I  
8 think we've asked Miss Hutchinson to obtain some copies  
9 of it.

10 THE COMMISSIONER: Oh, I see  
11 I see. All right. Well, we'll adjourn then until  
12 Tuesday at 1:30 in the afternoon. Tuesday, 1:30 in the  
13 afternoon. I anticipate that next week we will sit on  
14 Tuesday, Wednesday, Thursday, Friday, and likely on  
15 Saturday as well. I understand that all concerned were  
16 advised that/might well be sitting next Saturday, and  
17 if you didn't know about that, now you know. And I am  
18 advised by Miss Hutchinson that the hotel management is  
19 working on the airconditioning equipment for this room,  
20 and if it makes you feel any better, and it may, the  
21 manager in his office is just as uncomfortable as we are.  
22 So, we'll see you on Tuesday.

3 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

4 MR. SCOTT: Mr. Commissioner,

5 I thought it might be useful to all participants at  
6 this stage to tender as an exhibit a document entitled:

7 "Mackenzie Delta, a Summary Report of Surface  
8 Conditions".

9 It is a report prepared by Helen Kerfoot of the Terrain  
10 Sciences Division, Geological Survey of Canada, the .  
11 Department of Energy, Mines & Resources, and is a dis-  
12 cussion of the physical environment of the on-shore  
13 portion of the modern Mackenzie Delta, and it will be  
14 useful in view of the proposed alternate route across  
15 the delta. It is in part supplemented by recent  
16 field observations by the author, but the report is  
17 basically a synthesis of available data, both published  
18 and unpublished, that relates to the modern Mackenzie  
19 Delta. There is a bibliography and there is a map,  
20 and I thought that rather than simply indicate it's  
21 available, it might be marked as an exhibit and will be  
22 retained in the Inquiry Offices at Yellowknife for  
23 inspection by any interested participant or person.

24 (MACKENZIE DELTA SUMMARY REPORT OF SURFACE  
25 CONDITIONS MARKED EXHIBIT 126)

26 THE COMMISSIONER: So ordered.

27 MR. MARSHALL: Sir, you'll  
28 recall when we were last assembled that you asked Mr.  
29 Fielder for additional information as to the locations  
30 certain  
of/gas pipelines in the U.S.S.R., and he has over the

Fielder, Hurd, Carlson  
In Chief

1 weekend prepared some materials, some maps, and he  
2 has some remarks as well. He's had them typed up, sir,  
3 and I can distribute copies if you'd like. If it meets  
4 with your approval, I propose that he present that  
5 material now before cross-examination of the panel  
6 begins.

7 THE COMMISSIONER: Yes, cert-  
8 ainly.

9  
10 DONALD ERNEST FIELDER,  
11 LEE GORDON HURD,  
12 MELVIN E. CARLSON, resumed:

13 DIRECT EXAMINATION BY MR. MARSHALL (CONTINUED):

14 Q Mr. Fielder?

15 A You will recall, Mr.  
16 Commissioner, that I stated last week that there are  
17 three gas pipeline systems in the Soviet Arctic instal-  
18 led in areas containing permafrost. These are the  
19 Taas-Tumus Yakutsk-Pokrovsk Line in Eastern  
20 Siberia, the system I referred to last week as the  
21 Yakutsk line; secondly, there is the Messoyakha-Norilsk  
22 Line; and thirdly, the system of which I saw part which  
23 serves the Medverzhye Gas Field in Northwestern  
24 Siberia and which is sometimes referred to as the  
25 "Northern Lights" System. The presentation that was  
26 just given to you includes some maps which will help  
27 you locate those systems relative to better known  
28 places in Russia; but I can project them on the screen  
for the benefit of those who don't have that.

29 Sir, this map shows the U.S.S.R.  
30 and shows the three systems that I referred to. Firstly,

Fielder, Hurd, Carlson  
In Chief

1 excuse me for standing in front of it, firstly there  
2 is the Yakutsk system shown up here, and it actually  
3 runs from a place called Taas-Tumus through Yakutsk to  
4 Pokrovsk. You'll have to forgive the spelling.  
5 Every time one picks up a report, Russian names are  
6 spelled differently from the last time. To help get  
7 you oriented, the Port of Vladivostok is down here, so  
8 that's in Eastern Siberia.

9 The second system, the one  
10 that's entirely beyond north of the Arctic Circle  
11 running from Messoyakha to Norilsk and the system that  
12 I saw part of which runs from this general area here  
13 down through Nadym to Punga where it ties into  
14 a system that was constructed prior to that time.

15 This map shows the Soviet grid  
16 system that I referred to last week. You see Medverzhye  
17 here, and it runs down to what on this map appears to  
18 be Igrim but in actual fact is Punga. I think it  
19 must be a town very close by, but you'll see that  
20 once they get here there is access to Moscow into the  
21 south to the Ukraine, in the Caspian and Black Sea  
22 areas as well as virtually all of Western Russia.  
23 So far as I am aware, sir, this system is shown here  
24 to the north with dashed lines to Medverzhye to  
25 Ukhta has never been constructed.

1                   This map shows the Medverzhye  
2 area just a little more clearly. This is the  
3 Bay of the Ob River which runs up from this general  
4 area into this Bay at this point, flows into the Arctic  
5 Ocean and the Medverzhye field here running off to Punga  
6 where it ties into the system that we mentioned  
7 before and you can also see schematically the  
8 Messoyakha-Norilsk line on the same map.

9                   A blown up of the Messoyakha-  
10                  gas  
11 Norilsk pipeline system, you can see that it crosses  
12 a number of rivers, as it runs from Messoyakha through  
Fakel              on to Norilsk.

13                  The Messoyakha-Norilsk system  
14 as is the case for the Yakutsk system are local  
15 in significance, that is, they are not tied to the  
16 grid system.

17                  And once again, another  
18 blow up of the Messoyakha -- excuse me, of the  
19 Medverzhye system. You will note here also some  
20 discrepancies from some of the comments I will make in  
21 a few moments, it shows the length at 365 miles --  
22 or --67 miles, we were told 415 miles in length and  
23 it shows that the first 145 miles will be constructed a-  
24 bove ground and that is not the case. The whole system  
25 was constructed either on ground level or else was  
26 buried.

27                  That concludes the maps that  
28 I have to show you, Mr. Commissioner, and I will  
29 go back to the table now and tell you about those systems.

30                  Since we met last I extracted

1                           of  
2 from the reports/which I had copies and which described  
3 the visits of two separate groups to the Messoyakha-Nor-  
4 ilsk system, and from another report that I had not  
5 seen prior to this last weekend which was published by  
6 the American Gas Association in 1970 and it is called,  
7 "Gas in the Soviet Union", enough information to  
8 prepare a brief description of those three systems that I  
just showed you on the maps.

9                           Firstly, the Yakutsk system.  
10 The construction of the Taas - Tumus -Yakutsk-  
11 Pokrovsk gas pipeline, the first transmission gas  
12 pipeline to be built in the Arctic was begun in  
13 1964. The distance between Taas-Tumus and  
14 Pokrovsk is 356 kilometers which is about 221 miles.  
15 And 193 of those kilometers, or about 120 miles of that  
16 length was laid above ground on support. To  
17 Yakutsk the line is 20 inches in diameter, beyond  
18 Yakutsk to Pokrovsk the line is only ten inches. This  
19 line is of only local significance in terms of  
20 gas distribution but has been a useful testing  
21 ground for construction techniques in the permafrost.  
22 The last four sentences that I have just read are  
23 quoted directly from the American Gas Association  
24 report I described earlier, except for the conversions  
25 for the metric units for which I am responsible.  
26 I am sorry that I was not able to contact any of the  
27 people who saw this system in 1973 to get any more inform-  
28 ation.

29                           The Messoyakha-Norilsk System.  
30 To describe this system I have relied rather heavily on a

1 report prepared by Dr. R.S. Taylor, Ph.D., P. Eng.,  
2 who visited Russia in 1973 as a member of the  
3 Canadian Gas Working Group and who worked for Arctic  
4 Gas at that time; and a report prepared by the Gas Working  
5 Group who visited in 1972 as well as the AGA report  
6 described earlier. The system was located in 1967,  
7 the design started in 1968 and by mid-1970 gas reached  
8 NOrilsk. This information is extracted from the  
9 1970 report which differs from the 1973 report which  
10 says that the line was started in 1967 and completed in  
11 1968. The comments that follow are taken directly from  
12 Dr. Taylor's report:

13 "The first line was started in 1967 and completed  
14 in 1968. The second (looped) line was built in the  
15 winters of 1971 - 72 and 1972 - 73. Separation  
16 between the lines varies from 500 m to 4 km. There are  
17 at least four valved cross-over lines connecting  
18 the mains. The mains are manifolded on both banks  
19 of the Yenesei River, which is crossed under water  
20 by six, 40 cm lines. Besides this crossing, there are  
21 three major and 80 minor stream crossings. System  
22 length (single line) is 265 km; straight-line dist -  
23 ance to the field to Norilsk is 230 kilometers."

24

25

26

27

28

29

30

Fielder, Hurd, Carlson  
In Chief

1 As I mentioned last week to you,  
2 sir, that that was quite an extension from the direct  
3 straight line length, I think I used 13% last week, and  
4 the figure is actually 15%.

5 The pipe diameter is 72  
6 centimeters, wall thickness of 11 millimeters, of  
7 German low carbon steel No. 09-GC-2 steel No. 10.  
8 Operating pressure is 55 atmospheres, pressure drop  
9 along the line is 5 to 7 atmospheres in summer; 10  
10 to 12 atmospheres in winter. There are no compressor  
11 stations between the field and Norilsk. Operating  
12 temperature is ambient temperature, that is gas at  
13 well-head enters the gathering system at minus 1, plus  
14 2 degrees Celsius.

15 With a few short exceptions,  
16 the pipelines are all pile-mounted generally with  
17 bottom of pipe one meter or more above the ground  
18 surface. Piles are timber, reinforced concrete or  
19 steel pipe. Rest bars between piles are steel. Some  
20 of the exceptions are a few short test sections where  
21 the pipeline is laid on recessed horizontal supports  
22 with bottom of pipe at ground surface. The balance  
23 of the exceptions relate to stream crossings. Expansion  
24 is accommodated by V-sections about 20 meters by 200  
25 meters, at irregular intervals that appear to be about  
26 500 meters to 750 meters apart.

27 That concludes my quote from  
28 Dr. Taylor's report.

29 As I mentioned during my  
30 presentation last week, I was able to confirm during

Fielder, Hurd, Carlson

In Chief

the Soviet to Calgary on March 21, 1975, that the system does indeed currently consist of two 28-inch lines. That's 72 centimeters. This system is probably the most northernmost gas pipeline in the world, being laid in its entirety north of the Arctic Circle between the 69th and 70th Parallel. You will note that Dr. Taylor's Report goes into considerable detail in such areas as design, construction and logistics.

The Medverzhye to Punga system; in this instance I'll quote from my own report which was, I believe, circulated last week. The Medverzhye area contains gas reserves which are huge by North American standards, having proven reserves in the order of 14 trillion cubic meters. The Medverzhye field itself, 1.5 trillion cubic meters. For purposes of comparison, the 27 trillion cubic feet commonly stated as Prudhoe Bay-Alaska reserves amounts to less than 0.8 trillion cubic meters. Medverzhye gas production is estimated at an average of 24 million cubic meters per day in 1973 and 60 to 65 million cubic meters per day in 1974, which is about 2.3 billion cubic meters per day, is transported through a 48-inch and 56-inch trunkline system to Punga, near the Ob River where gas enters an established trunkline system extending to the Central European area of the U.S.S.R.

The first line laid had a diameter of 1,220 millimeters, or 48-inch. The loops which have been and are being constructed will be 1420 millimeter, or 56-inch. Including loops, the system consisted of about 1,500 km. of pipeline or about 930

Fielder, Hurd, Carlson  
In Chief

1 miles at the end of 1974. The distance from Medverzhye  
2 to Punga, 670 km. or 415 miles.

3 Large river crossings are  
4 buried in the river bed and are dualled or twinned. When  
5 the main crossing is 1,420 millimeter (56-inch), the  
6 spare crossing is normally 1,020 millimeter or  
7 42-inch.

8 The pipeline configuration is  
9 either buried or bermed. When buried the cover is  
10 normally 0.8 meters, or about 30 inches. When crossing  
11 marshes both buried and bermed configurations are used  
12 but the line is mostly buried because the water is  
13 usually only about 2 meters deep.

14 In permafrost areas roads are  
15 constructed by building up a gravel grade over tree  
16 limbs.

17 You'll recall, sir, that I  
18 described last week the terrain we overflowed. I explained  
19 that the area had not been glaciated and that perma-  
20 frost problems were minimal. To quote my report:

21 "What we saw was an area in which conventional  
22 winter pipeline construction techniques would be  
23 utilized in Canada, as it is very similar to  
24 Northern Alberta."

25 Five compressor stations will  
26 probably be constructed with spacing of 130 km., or  
27 about 80 miles. This rather large spacing is considered  
28 economical there. I visited one of these stations,  
29 I believe the only one built to date, called Long-  
30 Yuganskaya. It included six 6,000 kilowatt units

Fielder, Hurd, Carlson  
In Chief

(about 8,000 horsepower), each of which is able to move 18 million cubic meters per day. The station is not remotely controlled and is normally operated on a local automatic mode, although local manual is also possible. A station suction pressure of 55 atmospheres -- that's 810 p.s.i. approximately -- and a discharge pressure of 75 atmospheres -- about 1,100 p.s.i. -- are normal. Gas reaches this station using reservoir pressure (about 100 atmospheres) from the Medverzhye field. Suction temperature is about plus three degrees Centigrade, and discharge temperature about 40 degrees Celsius, which is the range of 37 to 104 degrees Fahrenheit.

Sir, I've attempted to excerpt the information you requested from the reports I have available to me and hope that I have presented the information you requested and that you find it useful.

Before I conclude, I'd like to make certain that I did not leave an impression last week that could be misinterpreted. I stated then -- and I quote:

"We will probably not learn a great deal more from additional visits to Russia," and that, referring to reports prepared by others, "perusal of their reports did not add a great deal to our knowledge of permafrost pipeline techniques."

IN a "nuts and bolts" sense, I believe what I said to be true. However, there is one very important thing

Fielder, Hurd, Carlson  
In Chief

1 we learned from what the Soviets have done and I think  
2 it's worth mentioning at this point. It is this --  
3 they got the job done. That is facing Arctic tempera-  
4 tures, winter darkness and the extreme logistical  
5 problems associated with both the climate and the  
6 geography, they did design and are still designing, up  
7 to eight lines from Medverzhye , they did construct  
8 and are still constructing, and they are operating at  
9 this moment, hundreds of miles of gas production, treat-  
10 ment, and pipeline facilities in their Arctic. I  
11 consider this accomplishment to be most commendable.

12 THE COMMISSIONER: Thank you  
13 very much, Mr. Fielder. I appreciate your taking the  
14 trouble to put those maps together and explaining  
15 them as clearly as you have.

16 A You're most welcome,  
17 sir.

18 MR. HOLLINGWORTH: Mr.  
19 Commissioner, last week on Thursday, I believe it was,  
20 you made an enquiry about what research El Paso had  
21 done into the frost bulb technique, and my solution  
22 was going to be to have a Foodhills representative in  
23 Washington check the El Paso application, but that  
24 deed was obviated when I spoke to Dr. Harlan, who  
25 briefly appeared on the last panel, who advised me  
26 that El Paso has decided that frost bulbs won't be  
27 since  
28 a problem'at river crossings their pipe is going to  
29 be coated with six inches of concrete which will  
30 provide effective insulation and there won't be a frost  
bulb problem. Now, that's their apparent solution.

Fielder, Hurd, Carlson  
In Chief

1 I haven't looked further into it than accept Dr.  
2 Harlan's words to me.

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 THE COMMISSIONER: Thank you,

2 Mr. Hollingworth.

3 CROSS-EXAMINATION BY MR. HOLLINGWORTH:

4 Q Mr. Hurd, where is the  
5 O &M office of the applicant?

6 WITNESS HURD:

7 A The head office or  
8 corporate office, Mr. Holingworth, would be in Calgary.

9 Are you asking about the operating company?

10 Q I am sorry, I said  
11 O & M, but I did not make it very clear.

12 A In Calgary.

13 Q And how many people on  
14 your staff are associated with the operations and  
15 maintenance phase?

16 A Mr. Hollingworth, are  
17 you asking about the operations staff as it will  
18 exist when the pipeline goes into operation?

19 Q No, I am asking about it,  
20 now, Mr. Hurd.

21 A The staff at the moment,  
22 the full time staff consists of Mr. Carlson and Mr. Fielder  
23 who have help available to them from consulting  
24 people and from a working committee of participant  
25 companies which would add upto another 15 or twenty  
26 people.

27 Q But they are not on the  
28 applicant's staff as such?

29 A No.

30 Q And, Mr. Carlson, are you

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 presently an employee of Trans-Canada Pipeline or of  
2 Canadian Arctic Gas?

3 WITNESS CARLSON:

4 A No, sir, I resigned from  
5 Trans-Canada Pipelines last month, I am now a permanent  
6 employee on Canadian Arctic Gas staff.

7 Q That is as of April, 1975?

8 A April 15th.

9 Q And are you permanently  
10 resigned from Trans-Canada, or are you on loan to  
11 Canadian Arctic Gas?

12 A No, sir, I am on permanent  
13 staff, I have severed my connection officially with  
14 Trans-Canada.

15 Q Now, did any of you  
16 gentlemen prepare the operations and maintenance  
17 procedure that has been set out in the application?

18 WITNESS HURD:

19 A Mr. Hollingworth, I  
20 was responsible for its preparation in the sense that  
21 I co-ordinated and was active in an overview role and  
22 to some extent an editing role. It was prepared  
23 by a lot of people.

24 Q Are those people presently  
25 with Canadian Arctic Gas?

26 A The advisory committee  
27 made up of participant companies are still with the  
28 companies that they were with before and still are an  
29 active committee and available to us. The consultants  
30 who assisted in the preparation are still consulting to

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 Canadian Arctic Gas. There are others who are no  
2 longer associated with the company.

3 Q Well, how many people  
4 are responsible for preparation of the actual material  
5 that you, the operation that you oversaw, Mr. Hurd?

6 A If we included in the  
7 count the operations and maintenance committee, the  
8 number would be well over 20, approaching 30.

9 Q And how many of those  
10 people are with companies no longer associated with  
11 Canadian Arctic Gas?

12 A I can only guess, Mr.  
13 Hollingworth, without checking, I would guess some  
14 half dozen.

15 Q And would those people  
16 be mainly with Alberta Gas Trunkline Company, Limited?

17 A Alberta Gas Trunkline  
18 contributed more people to that group than any other  
19 single company, that is true.

20 Q Presumably because they have  
21 experience in harsh climates in Northern Alberta, is  
22 that a fair statement?

23 A I think that certainly it  
24 is true that Trunkline has experience in Alberta and  
25 ranging some distance north, yes.

26 Q And was anyone associated  
27 with Westcoast Transmission instrumental in helping  
28 to prepare this documentation?

29 A No one, Mr. Hollingworth,  
30 who was associated with Westcoast Transmission at that

1 time.

2 Q AAnyone who is now associated  
3 with Westcoast?

4 A Not to my knowledge.

5 Q On page 19 of your prepared  
6 testimony -- I do not think that it is important to  
7 turn to it -- there is a statement made that maintenance  
8 of these systems and related equipment will utilize  
9 modular unit replacement. This is concerning communica-  
10 cation facilities, but actually what I was more  
11 interested in, was compressor station equipment. I  
12 think that I made the wrong page reference here. I  
13 think that the statement is made that you will use  
14 modular units on compressor station repairs where  
15 possible, is that correct?

16 A Yes, that is right.

17 Q Now, does this -- do  
18 the actual compressors lend themselves to this type  
19 of repair, Mr. Hurd?

20 A Yes, Mr. Hollingworth,  
21 they do. A large part of the equipment that will  
22 require maintenance will be the unit and station  
23 control panels. That equipment is electronic type of  
24 equipment and can be constructed so that parts of it  
25 can be extracted from the panel and replaced with  
26 workable parts and the part then, the damaged part or  
27 the faulty part is taken back for repair at other  
28 places.

29 Q I am sorry, you said that  
30 these were the electronic control panels?

A Yes, the unit and station  
control panels.

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1                   A better example might be  
2       the gas generator itself which, in an aircraft type  
3       turbine, can be changed in a matter of hours with  
4       a working unit, and the faulty unit is taken back to  
5       the factory for repair .

6                   Q     And are you using a  
7       turbine type of compressor?

8                   A     Until the purchasing  
9       process is completed, we can't be all that specific  
10      about which type will be used at which locations.  
11      It's likely that a large number of aircraft type  
12      turbine compressors will be used, and probably a number  
13      of industrial type turbine compressors also.

14                  Q     Well, are the industrial  
15      type turbine compressors easily exchangeable as  
16      modules?

17                  A     Less so than the aircraft  
18      turbine. Usually what they call the hot blade path  
19      is replaced in the industrial type. It takes longer  
20      but the industrial type operates for much longer  
21      periods between overhauls.

22                  Q     Well, how long does it  
23      take to replace one of these industrial type turbines  
24      in the event you had to pull out one because of a  
25      malfunction?

26                  WITNESS CARLSON: It would  
27      take up to one to two weeks with a crew of six or  
28      eight men. That is my best estimate. I can possibly  
29      get you some more details that are more accurate, but  
30      it is a more lengthy process as compared to the

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 replacement of a gas generator on a jet.

2 Q Well, let's turn to an  
3 aircraft type turbine, how long would they take to  
4 replace them on a module system?

5 A Trans-Canada has replaced  
6 a gas generator in about an hour and a half. We esti-  
7 mate normally six to eight hours with a four-man  
8 crew, and a supervisor.

9 Q Now, Mr. Hurd, you say  
10 that studies are still going on in this regard, but  
11 which way is the applicant leaning as to which type  
12 of compressor it's going to be using?

13 WITNESS HURD: I doubt if we  
14 could say at this stage, Mr. Hollingworth. Both the  
15 industrial and the aircraft are practical applications,  
16 have practical applications on this pipeline.

17 Q Does the industrial  
18 turbine have a greater capacity, a greater horsepower  
19 than the aircraft type?

20 A I believe both are  
21 available in sizes that are proposed for the pipeline  
22 system.

23 Q Are you sure on that,  
24 Mr. Hurd?

25 A Yes, quite sure, Mr.  
26 Hollingworth.

27 Q Now, is there any  
28 difference in the weight, supposing that you had the  
29 example of the inner guts of the turbine, if you  
30 like, breaking down, the whole engine. How much does

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 one of these machines weigh?

2 A They come in several  
3 parts. The compressor itself is the largest single  
4 component.

5 Q Do you recall the weight?

6 WITNESS CARLSON: I don't  
7 recall the weight of a compressor, but I can say the  
8 aircraft type gas generator of the type that might be  
9 considered for this project would weight approximately  
10 3,600 pounds.

11 Q And would the industrial  
12 type of turbine weigh more?

13 A Much more.

14 Q How much more?

15 A Unfortunately, I have  
16 no experience with the type of industrial unit that  
17 is being considered. The units Trans-Canada had were  
18 considerably smaller than this. Several thousands  
19 pounds more, or heavier.

20 Q Well, do you mean to  
21 say twice as much, sir, or three times as much?

22 A I'd prefer not to guess.  
23 If you want a precise figure we could get that.

24 Q Well, I'd appreciate  
25 a precise figure because I'm wondering if the aircraft  
26 you mentioned in your application are capable of  
27 bringing these machines in.

28 WITNESS HURD: Well, Mr.  
29 we mentioned earlier that  
30 Hollingworth, the part on an industrial turbine that  
would be replaced is what we call the hot blade path,

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 which is a very small part of the total. It's the  
2 inside part that's exposed to very high temperatures.  
3 That's easily transportable by aircraft.

4 Q So the larger whole,  
5 if you like, would not ever have to be replaced as  
6 a unit, as a complete unit?

7 A OH, I doubt if we could  
8 say not ever, but it would be a very unusual occurrence  
9 to need to replace the whole unit.

10 Q Well, suppose such an .  
11 unusual occurrence occurred, are your aircraft capable  
12 of bringing in such a unit as a whole?

13 A I don't know whether  
14 the aircraft is or not, it's the replacement of the  
15 unit is not that difficult a problem because very  
16 heavy equipment and machinery can be brought in over  
17 land on the sorts of vehicles that Mr. Fielder  
18 described earlier in the testimony.

19 Q It would be brought in  
20 by land from a wharf or from a depot, or where?

21 A Most of these components  
22 would be flown to a large airport and transported from  
23 there by land equipment.

24 Q When do you expect a  
25 decision to be made on which type of turbine you're  
26 going to use?

27 A It's sometime down the  
28 road, Mr. Hollingworth. The process usually involves  
29 negotiating with suppliers of equipment, receiving  
30 bids from them, determining which is the best

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1       considering the number of units that can be supplied  
2       by any one supplier. It's not likely that that process  
3       can be nailed down until we're prepared to make  
4       commitments to those suppliers, and that follows the  
5       obtaining of a permit.

6                   Q     O.K., well let's just  
7       keep on with the air strip discussion, or airplane  
8       discussion for a moment. You've got a discussion of  
9       various types of airplanes required in your applica-  
10      tion. I should say aircraft. That's on page  
11      12 and 13. I'm specifically interested in type C.  
12      That seems to be a fairly large plane, is that correct?

13                  A     Yes, it is.

14                  Q     And what sort of type of  
15      plane that's flying today would fall into this category?

16                  A     The Hercules, Mr.  
17      Hollingworth.

18                  Q     And what length of run-  
19      way does a Hercules need to take off at full load?

20                  A     I don't know precisely  
21      what the aircraft requires. I know that runways at  
22      Normal Wells and Inuvik and at those stations where  
23      we're proposing a 6,000-foot runway, would handle  
24      the Hercules.

25                  Q     O.K., would a shorter  
26      strip than 6,000 feet be able to handle it?

27                  A     My guess is yes, but  
28      I don't know the length required by that aircraft.

29                  Q     Does anyone know?  
30      Mr. Fielder?

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 WITNESS FIELDER: Well, I

2 think the 6,000-foot strip was intended for Hercules  
3 use, that's all I can tell you, Mr. Hollingworth.

4 Q Well, I take it from your  
5 evidence that you're saying that if a mishap occurred  
6 which required bringing in rather substantial equipment  
7 that it would be flown first to the nearest large  
8 airport, provided the Mackenzie Highway wasn't  
9 available.

10 WITNESS HURD: That's correct,  
11 yes.

12 Q And then it would be  
13 brought overland to the point of the rupture, is that  
14 correct?

15 A Are we talking about a  
16 compressor station failure?

17 Q No, I'm talking about a  
18 line failure, the heavy equipment that you would need  
19 to effect such a repair.

20 A The heavy equipment would  
21 be stored at compressor station sites and division  
22 headquarter sites, and would be moved from those points  
23 overland to the site of the break.

24 Q Would there not be any  
25 equipment that would have to be flown in then in the  
26 event of a pipe failure?

27 A No. It should be  
28 available all -- it is intended to be available within  
29 reasonable distances of all locations on the pipeline.

30 Q And this includes spare

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 pipe, does it?

2 A Yes.

3 Q Well, let's get onto a  
4 compressor station then. Suppose you had to bring in  
5 a new unit, a new turbine unit, as we were discussing  
6 before. Would this require the use of a large plane  
7 such as a Hercules?

30

1                   A       A Hercules would  
2 handle several of the gas generator units for an  
3 aircraft-type station. Probably, though, several of  
4 those units, the gas generator units would be kept  
5 in stock at places like Inuvik.

6                   Q       Have you made any  
7 final determination on that point?

8                   A       Not as to the precise  
9 number. It is pretty much conventional practice with  
10 pipeline systems to keep one for each or perhaps  
11 half a dozen aircraft gas generators in service.

12                  Q       Well, let's say that  
13 you needed a gas generator somewhere along the  
14 North Slope in the Yukon Territory, for instance.  
15 How do you plan to move it to the site where it is  
16 required?

17                  A       By -- Certainly it  
18 could be moved by land using the low ground pressure  
19 type vehicles that Mr. Fielder described.

20                  Q       Well, it couldn't be flown  
21 very successfully, could it? Because you have only  
22 one 6,000 foot airstrip between INuvik and the Alaska-  
23 Yukon border, isn't that right?

24                  A       The gas generator for  
25 an aircraft type, Mr. Hollingworth, could be hauled by  
26 the type D helicopter -- sorry, the type E  
27 helicopter, which has a sling load capacity of some  
28 8,000 pounds and the weight of a gas generator is some-  
29 thing roughly half of that.

30                  Q       Well, let's suppose

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 that you had an industrial type turbine in situ, are you  
2 suggesting that you would never have to carry such a heavy  
3 load such as would require a Hercules in order to effect  
4 repairs on a generator such as that? On a compressor  
5 station such as that, I am sorry?

6 A I think we would not suggest,  
7 Mr. Hollingworth, that we would never use a Hercules to  
8 carry material in to the nearest 6,000 foot airstrip.  
9 From that point the equipment if it was something as  
10 small as the hot blade path, probably could be carried.  
11 by that type E helicopter and certainly could be  
12 moved overland.

13 Q My studies of this map  
14 system of yours tends to show me that you have one  
15 6,000 foot runway between the Alaska-Yukon border and  
16 the vicinity of INuvik, is that correct?

17 A I would have to check to  
18 be sure.

19 Q So you /would have difficulty  
20 using a Hercules to any great extent along that  
21 north slope, wouldn't you, there is just one runway  
22 capable of accomodating it.

23 A You can only land where  
24 there are strips that long, that is true.

25 Q Besides the 6,000 foot  
26 runways you will require other airstrips and I presume  
27 you are going to maintain and carry on with the ones  
28 proposed for the construction period?

29 A That is correct.

30 Q Are you planning to close

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 any of these strips down that you used during construction?  
2 Or will all these be required to the operations and  
3 maintenance of the line?

4 A There are no airstrips  
5 that I am aware of which would be constructed for the  
6 construction program and abandoned after that.

7 Q These strips are going  
8 to be gravel, aren't they, Mr. Hurd?

9 A Generally, except for  
10 places like Inuvik where the existing airstrip is  
11 asphalt and Norman Wells, also.

12 Q But apart from the  
13 established Department of Transport airports, you  
14 are planning to construct your own and they will be  
15 of gravel?

16 A Yes.

17 Q And you are going to  
18 maintain those, obviously, in order to have landings and  
19 take offs throughout the lifetime of the pipeline?

20 A Yes.

21 Q That is going to require  
22 quite a bit of gravel, I would think.

23 A "Quite a bit" is a  
24 relative term; an adequate amount of gravel.

25 Q Have you made calculations  
26 as to whether borrow is available to carry out these  
27 repairs over the life span of the pipeline?

28 A To carry out repairs?

29 Q Repairs to the airstrips,  
30 maintenance of the airstrips.

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1                   A    We have made calculations,  
2 Mr. Hollingworth, to satisfy ourselves that there is  
3 more than adequate gravel to construct the airstrips  
4 and station pads and all other things that require  
5 gravel. The amount of gravel required to maintain  
6 the strips is a very small fraction of the amount  
7 required to build them. We propose to have stockpiles  
8 of gravel at airstrips and other locations where we  
9 can foresee the possible need for gravel. That amount  
10 required for maintenance would be very small.

11                  Q    Have you made calculations as  
12 to how much would be required?

13                  A    I have not made any  
14 calculations of that sort.

15                  Q    And do you know if the  
16 amount required for maintenance over the life span of  
17 the pipeline is included in the borrow requirement  
18 figures we have previously been given?

19                  A    I doubt, Mr. Hollingworth,  
20 that it was included as a specific item again, because  
21 the amount required for maintenance is very small compared  
22 with the total amount required to do the construction in  
23 the first place.

24                  Q    Has the applicant made  
25 any decision on what type of air cushion vehicle it will  
26 maintain in Inuvik?

27                  WITNESS FIELDER:

28                  A    No, sir, we have not.

29                  Q    Are you considering from  
30 a few certain types or is there a broad range available

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 to you?

2 A There is a range available  
3 to us, Mr. Hollingworth, from the 24 ton Voyageur that  
4 I described last week, which is self-propelled, through  
5 the 100 ton non-self-propelled air cushion raft. In  
6 addition to that, a great deal of work is being carried  
7 on at the moment to develop the technology of air cushion  
8 vehicles even beyond where it is today and I understand  
9 that there is 225 ton vehicle currently being used in the  
10 Middle East, so should we decide that we need something  
11 that big, it is available to us.

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 Q You say that the 100  
2 ton model that you're looking at is non-propelled.  
3 What is the largest self-propelled model you're  
4 looking at?

5 A The largest self-propelled  
6 that I am aware of is the Voyageur, sir, which would  
7 carry 24 tons.

8 Q Wouldn't you need a self-  
9 propelled A.C.V. to be of any use to you?

10 A No sir, you propell it,  
11 by some other means, like well for example it could  
12 be towed by another  
13 air cushioned vehicle, should it be  
decided to do so.

14 Q Well then you'd have --  
15 A More likely it would  
16 be towed by an L.G.P. type vehicle.

17 Q Well, the statement is  
18 made in the application, is it not, that the A.C.V.  
19 will be useful over river and spring breakup condi-  
20 tions?

21 A I'm not sure if that's  
22 the wording, but I'll accept it if you say it is, sir.

23 Q I'm referring you to  
24 page 11 of the application, Mr. Fielder. It says about  
25 three-quarters of the way down:

26 "An air cushioned vehicle which the applicant  
27 intends to have based at Inuvik to transport  
28 equipment and materials across water bodies  
29 during flooding and ice flow conditions."

30 A Yes sir, I see that.

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 Q So you couldn't very well  
2 tow it with a low ground pressure vehicle, could you?

3 A No sir, that couldn't be  
4 towed by a low ground pressure vehicle across the  
5 water, certainly not.

6 Q So you'd need a self-  
7 propelled one to be of any use to you in those condi-  
8 tions, wouldn't you?

9 A You would need a self-  
10 propelled one, certainly, to get across water during  
11 the time that ice was flowing down the river. You could  
12 also use the air cushioned vehicle, however, to get  
13 to the bank and then use helicopter to get across the  
14 bank -- across the river to the other side, and then  
15 be met with L.G.P. vehicles on the other side. You  
16 recall that we have a selection of equipment such as  
17 this at each and every compressor station.

18 Q A selection of low ground  
19 pressure vehicles, do you mean?

20 A Yes sir.

21 Q Now if this air cushioned  
22 vehicle is based in Inuvik, where do you envisage it  
23 being used mostly?

24 A Generally in the delta  
25 area and across the Yukon North Slope.

26 Q And there are severe  
27 ice conditions appear on the shore along the North  
28 Slope at certain times of the year, large mounds of  
29 ice building up on the shoreline, is that not correct?

30 A I believe that's right,

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 sir.

2 Q Now, taking as an example  
3 this 24-ton self-propelled machine that you've described,  
4 how large an obstacle can it overcome when it's  
5 travelling across the distance?

6 A I can't answer that  
7 precisely, sir, but if you'll accept a guess I'd say  
8 probably three feet in height.

9 Q Well, how high are the  
10 skirts on this machine?

11 A Sir, I just don't know.

12 Q Well, would you accept  
13 the fact that a Hovercraft has between its skirts and  
14 the surface crossing a small space which is called a  
15 Hover gap?

16 A Yes sir.

17 Q And that that Hover gap  
18 can't be too great or else the machine simply doesn't  
19 work and won't propell itself off the surface; isn't  
20 that not right?

21 A That's quite correct,  
22 sir.

23 Q Now, have you looked into  
24 the question whether it would cross a three-foot  
25 obstacle or not?

26 A Are you referring to the  
27 self-propelled machine, sir?

28 Q Yes, I am.

29 A No, I have not.

30 Q So you don't know for a

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 fact that it will cross such an obstacle.

2 A Not the self-propelled  
3 machine, sir. I do know that the raft that is made by  
4 Hoverjack can be constructed, and I was told this  
5 specifically by their chief engineer, to lift itself  
6 six feet off the water or off the ground surface.

7 Q Is that six feet the  
8 distance from the bottom of the skirts to the surface  
9 that's being crossed, or the distance from the base of  
10 the machine to the surface that's being crossed?

11 A From the base of the  
12 machine to the surface that's being crossed.  
13 You should know, though, sir, that the Hoverjack does  
14 not use a balloon type skirt such as the Arctic Systems  
15 air cushioned vehicle does, that is a 100-ton one, and  
16 hence ice flows, for example, or logs could hit the  
17 skirt and just pass underneath.

18 Q Well, what type of  
19 skirt or device does it use to achieve its lift?

20 A It's much like a loose  
21 drape. I don't know how else to describe it. It's just  
22 a thin material with a loose drape.

23 Q You mean it's a single  
24 sheet of material draping down?

25 A Yes sir.

26 Q Whereas a typical one  
27 is more like an inner tube attached to the machine, is  
28 that right?

29 A Not the typical one, sir.  
30 A different one. As I understand it, there are two

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

concepts that have been put forward in the design of air cushioned vehicles. One by the British and the other by the French, and I believe it's the British design that utilizes the balloon type skirt, the French one uses the other type. Both are currently in use.

Q      But the British one is more heavily developed than the French one at this time, isn't it, Mr. Fielder?

A I couldn't say that,  
sir.

Q Well now, taking again  
this 24-ton -- did you call it a Voyageur?

A Yes sir.

Q      What type of a gradient  
can it climb? Or can it climb any gradient?

A According to the specification sheet, about eight degrees.

Q And are there slopes greater than eight degrees along the North Slope route proposed by the applicant?

A There may well be.

Q You don't know?

A Once gain I'd have to get specific, because one could run down the river valleys to the point where you could get out of the river valley and then come back onto the right-of-way, for example. In other words, it's not necessary to follow the steep slopes, you can pick and choose your way.

Q Well, suppose you wanted

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 to get to a rupture some point between rivers on the  
2 North Slope. Wouldn't it sometimes be necessary to  
3 go up a gradient on the right-of-way to get to that  
4 point if you're using the air cushioned vehicle?

5 A Very likely.

6 Q And if that slope was  
7 greater than eight degrees, are you now saying that  
8 you couldn't reach it?

9 A No sir. I'm saying that  
10 you would get up that slope in a different manner,  
11 either you would find a shallower slope to get up, or  
12 you would start an L.G.P. type vehicle out from the  
13 compressor station on the other side of that break  
14 to meet the air cushioned vehicle, and when it got  
15 to that steeper slope it could be winched up the slope  
16 by the L.G.P. vehicle and carry on its way. In other  
17 words it can be helped by other means.

18 Q Of course, all this is  
19 taking some time.

20 A Yes sir.

21 Q Now, assuming again this  
22 break on the North Slope, if the A.C.V. was called  
23 into action from Inuvik, which way would it take to  
24 get to the North Slope? Would it go out over the  
25 Beaufort Sea?

26 A It would depend upon the  
27 time of year. Certainly if it was water, I suspect it  
28 would. If it was frozen --

29 Q Suppose it was ice.

30 A -- it would have to pick

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 and choose its route.

2 Q Over the Beaufort Sea?

3 A Yes sir, providing that

4 it could make it. I just don't -- assuming that you  
5 have no more than three-foot high ice , for example,  
6 it could probably make it. If you had six-foot ice,  
7 it probably would not. You'd have to take a different  
8 route, perhaps down one of the branches of the Mackenzie  
9 River, and then follow the right-of-way. It would  
10 depend where you're talking about, where the break  
11 occurred, where the air cushioned vehicle was at the  
12 time the break occurred, and what other vehicles were  
13 available to help it on its way.

14 Q But if it went down the  
15 Mackenzie River to the right-of-way it would at some  
16 point have to leave the river and get over to the  
17 right-of-way.

18 A Yes sir.

19 Q And again you might run  
20 into this problem with gradients, or you might run into  
21 trees, you might run into any number of obstacles.

22 A That's quite correct,  
23 but once again it could be towed.

24 Q What I'm suggesting to  
25 you is that this air cushioned vehicle could not be  
26 relied upon to be of any use whatever in the event of  
27 some mishap occurring along the North Slope.

28 A I disagree, sir.

29 Q Well, we've gone through  
30 some of the obstacles it might face. Do you not

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 agree with me there could be instances when it simply  
2 wasn't usable because it couldn't reach the site?

3 A I'll agree with you that  
4 such a circumstance could occur, but I don't believe  
5 that you've described it this afternoon, sir.

6 Q Well, would you describe  
7 the circumstance when it could occur, then, Mr.  
8 Fielder?

9 A Only, I believe, if the  
10 ice conditions in the Beaufort Sea and the rivers were  
11 such that it was impossible to pull anything that  
12 required less than six feet of clearance. I don't  
13 know that that condition ever occurs at one time  
14 everywhere. Even if that were the case, then of  
15 course one would during those times fall back on the  
16 other types of equipment that we have available to us.  
17 You could use the air cushioned vehicle, whenever it's  
18 practical to do so. As is the case with all of these  
19 vehicles, they have a particular application, and  
20 one chooses the circumstances under which one would  
21 use them.

22 I described last week, for  
23 example, that a rologon could carry 30 tons. Start  
24 out three rologons and have essentially the same  
25 load as one air cushioned vehicle, over ice.

26 Q O.K., well on page  
27 14 then, the last paragraph, there is a discussion of  
28 line patrols by fixed wing aircraft, and it's stated  
29 that fixed wing aircraft would be used on flat  
30 country and rolling country, is that right, Mr.

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1 Hurd?

2 yes.

3  
4 Q And otherwise you would  
5 have to use helicopters.

6 A Helicopters are another  
7 option, yes.

8 Q Are there further  
9 options as well?

10 A For line patrol,  
11 depending on the time of year you could use all  
12 terrain vehicles; in the wintertime certainly personnel  
13 carriers that can go along the surface and in the  
14 wintertime without risk of damage to the surface  
15 terrain. There will be occasions, I can imagine, where  
16 on the ground foot patrols would be done.

17 Q And in summer?

18 A In summer generally  
19 aircraft would be very much the preferred method  
20 because it keeps the patrolling people off the ground  
21 altogether.

22 Q Well, if you had to  
23 accept the interior route rather than the coastal  
24 route coming from Prudhoe Bay, what type of country  
25 does that cross?

26 A It's more mountainous,  
27 even in the Canadian portion, than the coastal route  
28 is. They are not large and rugged mountains like the  
29 Alaska section of the interior route. It's rolling,  
30 some areas are flat near the Old Crow Flats it's quite

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth

1           gently rolling and flat.

2           Q     Well, would you be able  
3           to use fixed wing aircraft along the interior route?

4           A     Yes sir.

5           Q     The entire way?

6           A     Yes sir.

7           Q     Well, if that country is  
8           suitable for fixed wing aircraft, where are the  
9           areas where helicopters would have to be used?

10          A     There are no areas that  
11         I am aware of where helicopters would have to be  
12         used. Fixed wing aircraft, small light fixed wing  
13         aircraft is usable along the whole of the system.

Fielder, Hurd, Carlson  
Cross-Exam by Hollingworth  
Cross-Exam by Templeton

1                   Q     I was just wondering, further  
2 up that page it says, "Where the use for the fixed  
3 winged aircraft for line patrol is not practical,  
4 helicopters will be used on line patrol." Where,  
5 geographically, are those areas going to be?

6                   A     There may be areas in  
7 particular -- in particularly mountainous terrain  
8 where a helicopter would be more desirable perhaps, in  
9 a particular situation, weather situation, than the  
10 fixed winged aircraft. The helicopters are more  
11 desirable in situations where you might wish to drop  
12 down to the ground so that people can walk around and  
13 inspect it more closely. But given reasonable weather  
14 conditions, the fixed wing aircraft can cover the  
15 whole of the pipeline.

16                  Q     So the meaning of that  
17 statement isn't with reference to geographical areas,  
18 it is with reference to flying conditions and the  
19 desire to get down closer to the ground, is that more  
20 correct?

21                  A     That would be the  
22 advantages that a helicopter has over the fixed wing,  
23 yes, sir.

24                  MR. HOLLINGWORTH:    Okay,  
25 thanks, gentlemen.

26                  CROSS-EXAMINATION BY MR. TEMPLETON:

27                  Q     If I ask my questions now  
28 it will guarantee that they will be finished with me in  
29 short order.

30                  In your statistical summary

1      regarding ruptures, which I believe was in the answer  
2      to question 22 of the PAAG report on off-road  
3      vehicle traffic required for contingency repairs and  
4      I think that you worked out the breaks and the frequency  
5      of ten and a half years for a break. And then later  
6      on on page 2219 you state at the top of the  
7      page,

8            "The applicant refers to its response to  
9            sub-section one of question 22 in which it  
10          determined the frequency of the need to make  
11          major pipeline repairs is very low, i.e.,  
12          statistically it is perhaps once in twenty  
13          years."

14         Continuing the quotation:

15          "Where a major repair is necessary, the  
16          probability of it occurring at a location  
17          and during a season in which critical and  
18          environmental sensitivities will be a  
19          serious consideration is of course very  
20          much lower."

21         I was wondering -- I am not questioning the difference  
22         between whether the frequency is ten and a half or  
23         22, it is the statistics in which the -- were made and  
24         do they apply to maturely operating pipelines, is that  
25         the whole industry of the United States or of Canada?  
26         Is this a United States and Canada figure?

27            A Mr. Templeton, we quoted both.  
28         The United States statistics were compiled by the  
29         Battelle Institute and are contained in a report prepared  
30         for the American Gas Association dated May of 1973

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1 entitled, "Reportable Incidents for Natural Gas  
2 Transmission and Gathering Lines, 1970 through 1972".  
3 that is the one that resulted in a statistical probability  
4 for breaks north of 60 on this system of some one every  
5 ten and a half years. The Canadian statistics were  
6 gathered from three major gas transmission companies  
7 operating in Canada and operating between them a  
8 total of some 7,000 miles of 30" to 42" diameter  
9 pipeline over a period of about 17 years.

10 Q But do the statistics

11 refer to the -- all of the pipeline -- in other words, when  
12 do the statistics start when the pipeline is put in  
13 operation?

14 A I am not sure, Mr.

15 Templeton, that I understand the question. That last  
16 part seemed to be the answer.

17 Q Well, when is the

18 break in period? You build the line, you test it, and  
19 breaks occur -- otherwise you wouldn't test it, and  
20 so then you -- somewhere in that period, comes the  
21 time when you say, now I am on operation. Is that the  
22 time when the statistics are started to compile?

23 A Now I understand.

24 U.S. statistics covered the years 1970 through 1972 and  
25 covered some -- an average over those years of some  
26 12,800 and some odd miles of pipeline. I am sure  
27 that the great bulk of that pipeline was constructed  
28 before the period that was examined. Therefore it was  
29 a period selected after those pipelines had been in  
30 operation in some cases for some time and in other cases

1 for shorter periods of time. The Canadian statistics  
2 are reported over a period of some 17 years and I can't  
3 be certain without checking, my understanding of that  
4 would be that statistics began to be collected after  
5 the pipeline went into operation.

6 Q So that there is a  
7 period, perhaps before this work-in period where there  
8 can be line breaks considerably in excess of this that  
9 would not affect the statistics.

10 A Not a work-in period after  
11 the line went into operation, Mr. Templeton, the testing  
12 program, if it resulted in breaks, would not  
13 be included in these statistics.

14 Q Well, I think in the  
15 April '73 interdisciplinary meeting that you have  
16 quoted a number of times and which I believe is  
17 exhibit 85. There was quite an exchange between  
18 Mr. Morden who was then the operation and maintenance  
19 man and Mr. Walker who is the construction man and I  
20 realize that both of them have gone now, but, as to  
21 when the break-in period was and my understanding of  
22 that time was that they were going to have two  
23 years called the construction period, and is that still  
24 the condition?

25 A There is a two year  
26 period, approximately two year period, during which  
27 separate sections of the pipeline system are constructed  
28 and at the end of which the total pipeline system goes  
29 into operation from the Richard's Island area.

30 Q Well, I think what I am

1 getting at is that this is a period when there is  
2 much greater risk of land breaks and there probably  
3 will be for sometime thereafter and that this would  
4 not be reflected in the statistics that were presented.

5 A Those land breaks, Mr.

6 Templeton, are breaks that might occur, if any do,  
7 during the testing program and the testing is done  
8 hydrostatically and is a very different phenomena than  
9 the line break on an operating pipeline that is filled  
10 with gas.

11 Q Yes, but if -- I am in-  
12 terested in the environmental aspects and it does not  
13 really matter why the line breaks or how it breaks, you  
14 have to repair it regardless of whether it has gas  
15 in it or a fluid.

16 A I understand, -- the  
17 difference perhaps is that during the testing program  
18 which is a part of the construction program, equipment  
19 for making repairs is right there and the testing and  
20 the repair would be done during the construction  
21 season.

22 Q Well, I wonder if that  
23 is always the case or if you are working at a very  
24 compressed schedule, in the winter time and you have  
25 a close off date where your entire operation is working  
26 towards, we will say March the 30th, when everything  
27 must shut down, I am not sure that all of those  
28 operations can necessarily be programmed to coincide  
29 with a shut down date of one particular day and say  
30 under no circumstances will we ever repair a line break  
after March the 30th, can you say that?

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1 A I think all

2 we can say, Mr. Templeton, is that the construction  
3 program we were listening to -- this panel was listen-  
4 ing carefully to the evidence given by that panel --  
5 construction program includes a safety factor built  
6 into it to take account of any of the causes of delay  
7 so that work after the safe construction period can  
8 be avoided. One of those causes might be a line  
9 break during test that occurs towards the end of the  
10 construction season.

11 Q I hope you don't have  
12 the optimism of Mr. Drapeau. Mr. Carlson, do you  
13 remember how many line breaks there were in testing  
14 of the original Trans-Canada Pipeline?

15 WITNESS CARLSON: Yes sir.  
16 I believe it was 18, 17 of which were the result of  
17 cracks that occurred in the pipe during rail shipment.  
18 This phenomenon was somewhat new to our industry, since  
19 about 1962 Trans-Canada has used the Bechtel organiza-  
20 tion to design and the packaging of up to 80-foot  
21 lengths of pipe for railroad shipment. These cracks  
22 were in the order of three to four inches in length,  
23 and we had some spectacular failures during testing  
24 the original line.

25 Q Yes, it was spectacular  
26 because you were testing with gas, natural  
27 gas rather than --

28 A That's right.

29 Q This one will not have  
30 the spectacular things, but breaks do occur ?

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

A I would submit this one  
will not have that type of defect built into the pipe.

Q No, I suspect that --  
but then there are different conditions such as much  
greater wall thicknesses and brittle fracture or lack  
of ductility due to the very cold temperatures, and  
probably there are different situations and that there  
can be breaks in this line, too.

A I would submit, Mr.  
Templeton, that most of the breaks that have appeared  
in statistics that have been published, occurred in  
what we would refer to as first generation pipeline  
steels. I know in Trans-Canada's experience since  
about 1967, and this covers several hundreds of miles,  
I am sure well over 1,000, possibly 2,000 miles of  
loop line, Trans-Canada has not had a rupture during  
field testing of new pipelines built with present-day  
technology steels.

Q Yes, but/Trans-Canada  
put in this sort of mileage in the wintertime? A  
great deal of that went in the summertime, didn't it?

A A great deal, I would  
say about 50-50. We start, launched into a winter  
construction program in 1971, and I think we had close  
to 1,000 miles of pipeline built in the winter since  
that time.

Q But not with this wall  
thickness. Right?

A No sir.

Q And the brittle fracture

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1 or lack of ductility of pipe is related to the greater  
2 wall thickness, the greater the problems of  
3 lack of ductility, right?

4 A Well, present-day  
5 specifications spell out a ductility which is much  
6 superior to the original pipeline steels that went  
7 into older pipeline systems.

8 Q Oh yes, I realize that.  
9 A And the phenomenon  
10 of brittle failure is one we have not experienced for  
11 many years in new pipeline steels, during test.

12 Q To get back to statistics,  
13 the statistics apply to our projection from known occurrences; is this right?

14 A That's correct.  
15 Q But there have not been  
16 States  
17 in Canada or the United/<sup>States</sup> these conditions under which  
18 to build pipelines. Is that right? I'm talking now  
19 about frost heave, permafrost, chilled pipelines,  
20 large diameters, thick wall thicknesses, so I'm having  
21 a little difficulty projecting the statistics of  
22 Canada and United States in the existing pipelines into  
23 north of 60.

24 WITNESS HURD: Many of the conditions,  
25 Mr. Templeton, are beneficial when making the projection  
26 into Arctic conditions. The Arctic is not all bad  
27 news. Well, two good examples, firstly the major  
28 cause of pipeline breaks in operating pipeline are  
29 causes by outside forces or damage caused by third  
30 parties working near or on the pipeline. Perhaps about

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1       50% of all operating pipeline breaks result from that  
2 cause. The population density, industrial activity  
3 and other activity in the Arctic is very much less, of  
4 course, than it is in southern regions, and that  
5 cause will be very much less in the Arctic.

6                          Another example is that a  
7 significant cause of pipeline breaks is corrosion that  
8 occurs, historically has been corrosion that  
9 has occurred on the pipeline. Again the Arctic environ-  
10 ment is much more conducive to a safe pipeline since,  
11 corrosion is much less likely to occur.

12                         Q      Well then, let's tackle  
13 frost heave.

14                         A      Frost heave is unique  
15 to the Arctic and has received a lot of careful study  
16 by the group, we are satisfied, confident now that we  
17 predict areas in which frost heave will occur, that  
18 we can minimize the chance of it occurring to any  
19 extent that is harmful, and that in areas where  
20 the risk is marginal and protective measures probably  
21 are not required, the pipeline can be monitored during  
22 its operating years. One thing about frost heave is  
23 it occurs very slowly and there is opportunity to  
24 detect it and take corrective measures if it happens.

25                         Q      Yes, I accept that;  
26 but I keep coming back to the problems encountered when  
27 you're correcting these things. Now, I think Mr.  
28 Fielder explained previously how the problem of going  
29 around to a circuitous route so that he would avoid  
30 the six-foot obstruction, and these are all probably

Fielder, Hurd, Carlson  
CrossExam by Templeton

1 necessary to repair that break, but a lot of those  
2 things leave some terrain degradation of one kind or  
3 another, or a mark, and I wonder if you've considered  
4 what this does? Do you consider the value of land in  
5 its natural state as a component of the environment  
6 that which has to --on which you have to spell out  
7 impact, or to demonstrate impact?

8 A Was that a question, Mr.

9 Templeton?

10 Q Yes. It was meant to be,  
11 I don't know whether it turned out that way. Do you  
12 consider -- sorry.

13 A We would certainly not  
14 like to leave the impression that the pipeline can  
15 be operated without ever making a track on the Arctic  
16 terrain. I think what we do say is we can minimize  
17 damage to the Arctic terrain, using the type of  
18 equipment that Mr. Fielder described, and at the same  
19 time make the repairs that are necessary. We would say  
20 also that whatever damage is caused can be repaired,  
21 using methods that are proposed for the construction  
22 of the pipeline, and that the damage that is likely  
23 to be caused by operating procedures is very much less  
24 than what would be caused by trenching, and which can  
25 be repaired by re-vegetation and other methods.

26 Q Well, to get back to  
27 that re-vegetation, I think you say on page 22-7 of  
28 question 22 of the PAAG report, I'm not sure I can quote  
29 the whole thing, but I think you refer to re-vegetation  
30 to restore ground cover. Do you mean that you can

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1 restore the vegetation, or restore vegetation, or do  
2 you mean restore the terrain? In other words you're  
3 saying, "I can grow some perhaps grass in this, and  
4 that restores the vegetation." But does it restore  
5 the thermal balance?

6 A We think, Mr. Templeton,  
7 that the thermal balance can be maintained by protecting  
8 the areas where the natural vegetation has been removed,  
9 in some cases with a temporary cover which might be  
10 an organic material held down with wire netting, or  
11 plastic netting; and that re-vegetation can proceed  
12 and that ultimately the re-vegetation will provide  
13 the protection -- thermal protection that is necessary.

14 Q What will you consider  
15 "ultimately?" How many years?

16 A Quite quickly protection  
17 would be provided by the grasses that would be seeded  
18 with fertilizers which would grow quickly. We think that  
19 over a period of many years the natural vegetation  
20 would encroach upon those imported grasses and that  
21 the natural vegetation would prevail.

22 Q Yes, but I think there's  
23 a difference between restoring vegetation and restoring  
24 I think thermal balance. All the reports, including yours,  
25 would indicate that the restoration of a thermal  
26 balance in an area where the peat mat had been dis-  
27 turbed or taken off is in much -- I think there's perhaps  
28 a little difference of opinion on the number of years but  
29 certainly it's not in ten years. I'm not talking  
30 about physical erosion; I'm talking about thermal

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1      balance.

2                  A      Thermal balance has  
3 significance, I think, only where a change in thermal  
4 balance would cause a regression of the permafrost which  
5 in turn might result in erosion. So the object --

6                  Q      This goes back to the  
7 other question, though: Do you consider the preserva-  
8 tion of land in its natural state part of your impact?

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1                   A     Consider that we have an  
2 obligation to preserve the land in as near as possible,  
3 and practical, in its natural state, yes, sir.

4                   Q     But Mr. Fielder is going  
5 to wander around with his -- and I realize that he is  
6 not going to tear up the -- all the tundra with his  
7 low pressure vehicles, but these do leave marks and I  
8 think that you would agree, would you not, that the  
9 marks around Prudhoe Bay and the hillsides are objectionable.  
10 I realize that Mr. Fielder is not going to make that  
11 kind of mark as those are now five, six feet deep,  
12 but he will leave marks, will he not?

13                  A     If by marks, Mr. Templeton,  
14 you mean tracks that can be seen, that is very possible,  
15 that at certain times of the year tracks will be left  
16 that can be seen. That is not necessarily followed by  
17 a change in the thermal regime and permafrost degradation  
18 and erosion and all those terrible things.

19                  MR. FIELDER:

20                  A     If I can interject, most  
21 of my wandering around was being done on the ice,  
22 Mr. Templeton, just a little bit on land.

23                  Q     Well, I am not sure it  
24 was now, I think you were going to try and get as  
25 close as you could to that site, but then you were going  
26 to bring another vehicle in.

27                  I think there are obstructions  
28 over six feet, I just don't know anywhere in the north  
29 where there aren't so I assume that you have to go  
30 around quite a few things and I think that the point is

Fielder, Hurd, Carlson  
Cross-Exam by Templeton

1 that some of these things regarding maintenance do  
2 occur outside the right-of-way, and that there are other  
3 things to consider the impact rather than  
4 just the 120-foot strip and that your operations and  
5 maintenance do extend beyond that. I think that  
6 there seems to be a tendency perhaps to forget that.

7 THE COMMISSIONER: Mr. Templeton  
8 what were the marks that you refer to at Prudhoe Bay,  
9 they were obviously more than marks, what caused them?

10 MR. TEMPLETON: These were  
11 caused by bulldozers and I think that there is one  
12 famous one where a bulldozer operator decided to indicate  
13 to a friend where he was going and so he left -- made an  
14 arrowhead by making tracks on the tundra and that mark  
15 today has gone down, I think about six feet, because he  
16 disturbed the tundra, disturbed the insulating mat, and  
17 then the mat started to melt and it is not stopped --  
18 that was done -- I have forgotten how many years  
19 ago, but perhaps, five, six, seven years ago, it is  
20 down six feet today and I do not think anybody has  
21 predicted where that stops. Obviously it will somewhere,  
22 but it is a slow process. Now, I am not trying to compare  
23 what Mr. Fielder is doing with a low pressure vehicle with  
24 that Cat track, but, even if it were a depression of  
25 a foot, which, perhaps, he might argue is too much too,  
26 it would be offensive to a great many people as a -- from  
27 esthetic value and if there were vehicles of some kind  
28 that disturb it, of course then you would get a trench  
29 and this is only in the areas of high ice content.

30 I think that is all I have,

1 Mr. Chairman.

2 THE COMMISSIONER: We will  
3 take a brief adjournment now then.

4 (PROCEEDINGS ADJOURNED)

5 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

6 CROSS-EXAMINATION BY MR. LUCAS:

7 Q Mr. Hurd, in your operations  
8 and maintenance plan have you made specific provision for  
9 environmental surveillance and monitoring by the  
10 relevant government agencies? Have you taken that  
11 into account?

12 WITNESS HURD:

13 A Not in a specific way,  
14 Mr. Lucas. We recognize that there are authorities  
15 who are concerned with that and have been in the past  
16 and we expect that they will continue.

17 Q You realize, do you,  
18 that off right-of-way vehicular movement will be  
19 governed to a large degree by land use permits under  
20 the territorial land use regulations?

21 A We are aware of those  
22 regulations, yes sir.

23 Q And have you taken that  
24 into account? In terms of dealing with line break  
25 contingencies?

26 A We recognize that, for  
27 example, the construction of what Mr. Dau referred to  
28 as -- or as Mr. Williams referred to as a shoo-fly road,  
29 that sort of thing would require authorization from the  
30 responsible authority.

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 Q I am referring specifically,  
2 Mr. Hurd, to the movement off right-of-way of heavy  
3 vehicles, whether on a prepared road surface or not.  
4 Have you taken into account the fact that permits may  
5 be required for that sort of activity?

6 A Yes, sir.

7 Q And have you built that  
8 into your contingency plans?

9 A We are aware of it, Mr.  
10 Lucas. There is nothing I can think of at the moment  
11 that requires building into the plan. The plan includes  
12 obtaining all of the authorizations that are necessary  
13 to allow us to travel where it is necessary.

14 Q Could you refer, Mr.  
15 Hurd, to page 31 of section 13 B.

16 This is under the head, "Imple-  
17 mentation of Contingency Plan", and the passage  
18 that I am referring to is in the second paragraph on  
19 page 31 under the heading, "Reporting". The section  
20 describes how a line break contingency would be dealt  
21 with and then in the second paragraph on page 31 it is  
22 stated, quote:

23 "When the line repair is completed and the  
24 pipeline is returned to normal operation,  
25 the District Superintendent will prepare  
26 a comprehensive report for submission  
27 to the applicant's management and relevant  
28 government agencies."

29 Now, Mr. Hurd, does this mean that it is not con-  
30 templated in your operations and maintenance plan that

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 relevant government agencies would be advised of the  
2 occurrence of line breaks until they had been taken  
3 care of?

4 A No, sir.

5 Q When would they be advised?

6 A As early as it is reasonably  
7 practical to do so.

8 Q Could you explain that,  
9 please?

10 A As soon -- if a line break  
11 occurred, as soon as the operating company was aware  
12 of the break, then government agencies who would be  
13 concerned would be advised.

14 Q Okay, so the relevant  
15 governmental agencies would be advised immediately  
16 upon the discovery of a line break?

17 A Yes, sir.

18 Q Mr. Hurd, just carrying this  
19 one step further. In dealing with line break contingencies,  
20 would the resulting documentation and reports prepared  
21 following a line break be available to the general  
22 public? Could the public get copies of this  
23 material?

24 A I don't know, Mr. Lucas,  
25 whether they could be immediately available through  
26 the company. There are regulations requiring that  
27 reporting on land breaks, including the causes and  
28 methods of repair and timing be made to the National  
29 Energy Board and there is a requirement of that Board  
30 also that the Board be notified immediately on the

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1      occurance of a break. Whether the Board might have  
2      some influence on whether the report was made available  
3      to the public generally, I don't know. I can think  
4      of no reason why the operating company would try  
5      to withhold it.

6                    Q      Well, Mr. Hurd, as a  
7      matter of Arctic Gas policy, would these materials  
8      be made available to the public?

9                    A      Mr. Lucas, I am not  
10     sure that I can speak as a policy witness. I hesitate  
11     a little bit because there may be situations where  
12     initially it might be suspected that the cause of the  
13     break for example was a flaw in the pipe and which  
14     might cause the company to want to go and talk  
15     with the supplier of the pipe and that -- those discussions  
16     could be jeopardized if the details of the metallurgy  
17     was made public. I just do not know.

18                   Q      So the company has not  
19     developed a policy on this yet?

20                   MR. MARSHALL: Well, Mr.  
21     Lucas, we have made it clear that a policy witness  
22     will be called and as Mr. Hurd has indicated to you,  
23     he does not really feel that he can speak as a policy  
24     witness in these areas, but perhaps you might wish to  
25     put that same question to Mr. Horste.

26                   THE COMMISSIONER: Mr. Lucas,  
27     why don't you put that question to Mr. Horste. If  
28     he says, "We haven't developed a policy", or if he  
29     says, "We have developed a policy and this is our  
30     policy", in either event, it seems to me that subject

1 to what other counsel might say in due course you are  
2 entitled when we reach the stage of making submissions,  
3 to argue that the Inquiry ought to recommend that  
4 the report be made public or not made public or  
5 sometimes made public and at other times not made public,  
6 as you wish, but there is not much point in pursuing it  
7 with Mr. Hurd, is there?

8 MR. LUCAS: Well, perhaps I  
9 can get this clear. These gentleman are employees  
10 of Canadian Arctic Gas, is that correct?

11 A That is correct.

12 Q But notwithstanding  
13 that fact, this panel will not speak to policy matters,  
14 is that correct?

15 MR. MARSHALL:: Well, I think  
16 you can ask him whether or not a policy has been  
17 developed on this specific point and if so he will  
18 speak to that question, but if you get into the  
19 area of will the company establish a policy to do thus  
20 and so it seems to me you have to speak to management  
21 of the company.

22 THE COMMISSIONER: I think  
23 that is sound. I do not really see how you can expect  
24 Mr. Hurd to make up company policy as he goes along  
25 if it hasn't been developed yet.

26 MR. LUCAS: I guess I wanted  
27 to clarify the situation regarding Mr. Horne and these  
28 witnesses since they are all officials of the applicant,  
29 Canadian Arctic Gas. I think I have the breakdown clear.

30 THE COMMISSIONER: I do not know

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 if they are -- I do not want to pretend that I do not  
2 know anything about it but they are not officers  
3 of the company -- I do not think that they are.

4 MR. LUCAS:

5 Q Are you, Mr. Hurd?

6 A No.

7 MR. SCOTT: Mr. Commissioner, just  
8 one point at this time I am glad to hear Mr. Marshall  
9 say that Mr. Horte will be able to answer questions  
10 of this type because I was rather concerned by something  
11 said last week that Mr. Horte would be able to answer  
12 only very generally about policy matters and would not  
13 be able to give detailed analysis of policy decisions,  
14 but I understand now from Mr. Marshall that at least  
15 he will be able to answer questions of this kind  
16 of particularity.

17 MR. MARSHALL: I think you  
18 were not listening to my remarks, Mr. Scott, I said that  
19 Mr. Lucas might wish to ask Mr. Horte what the company's  
20 policy was. Frankly, I don't know, I cannot say  
21 what Mr. Horte's answer to that question would be.

22 MR. SCOTT: I am afraid I  
23 was listening.

24 MR. LUCAS: Can I ask a  
25 question?

26 Q Okay, just one more  
27 question along the same line, Mr. Hurd, and perhaps  
28 this matter will have to be taken up with Mr. Horte  
29 as well. The question is, have you considered and  
30 taken into account in developing the operations and

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 maintenance plan, the possibility of co-operating  
2 with an independent environmental monitoring group  
3 and what I have in mind is the Arctic Environmental  
4 Counsel, the group that has been established in  
5 Alaska under the auspices of the Arctic Institute  
6 of North America to monitor construction of the  
7 Trans-Alaska Pipeline. Have you taken that possibility  
8 into account?

9 A Are you asking, Mr. Lucas,  
10 about the environmental monitoring during construction?

11 Q Yes, and during operations  
12 of the pipeline as well.

13 MR. MARSHALL: I think it goes without  
14 saying--  
15 Q You could speak to the latter,  
presumably.

16 A We have  
17 not considered an independent environmental monitoring  
18 organization in the sense that there would be some  
19 sort of formal arrangement made with that independent  
20 group. We can imagine that there will be a variety of  
21 independent groups each of which will have information  
22 on the environment and that will be one of the many  
23 sources that our own environmental people would go to  
24 find out information about, for example, the current  
25 state of the caribou migration and other things that  
26 will be useful for the operating people to know about. I  
27 guess we would include ourselves as a source of considerable  
28 information on changing environmental situations..

29

30

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

THE COMMISSIONER: Mr. Lucas,

do you say that in Alaska the Alyeska Company has been required as a matter of law, or has decided as a matter of policy, to make certain material available to the Arctic Environmental Council, which I take it is a public interest group in the sense that it is not -- it has no Statutory powers?

MR. LUCAS: Yes. My understanding, sir, that it has decided to do this as a matter of policy, and that's a question that we'll be putting to Mr. Horte. Have you got that, Mr. Marshall?

MR. MARSHALL: I get a copy  
of the transcript.

MR. LUCAS: Q Mr. Hurd,  
turning to page 3 of Section 13 B, in the second  
paragraph it is stated, and I quote:

"As the operational stage approaches, a detailed operations and maintenance procedures manual will be developed and issued for reference and observance by operating personnel."

Now, this detailed operations and maintenance procedures manual, will the manual include details of procedures to be adopted to minimize environmental damage by various operations and maintenance activity?

A Yes sir.

Q And are you in a position to say what subjects will be covered?

A I might give some examples,  
Mr. Lucas. Whether that would be a very complete run-  
down is another question. For example, the caribou --

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

herd

Porcupine caribou migration moves from North-Central Yukon northward toward the coast and through areas where the coastal route of the pipeline would be, turns from there and goes west, calves in the area along the coastal plains, and migrates from there further west and then sort of mills around in that area. There are times when disturbance to the herd would be serious. At the same time, there will be a need to patrol the pipeline. One of the things that the operating people who are patrolling the pipeline would be required to do would be to be aware of where the caribou are, and what they must do to avoid disturbance to the herds, especially during calving periods.

Another example would be means by which they can minimize damage to the terrain when ground travel is necessary, and methods for repairing any damage that might occur to the terrain. Probably the staging and moulting of migratory birds along the North Coast is another example that the operating people would need to be aware of, and this manual would describe the staging activities and what must be done to avoid undue disturbance to them.

Q Now, what is the schedule for completion of this manual? Will it be completed prior to regulatory approval?

A No sir.

Q Mr. Hurd, at page 18 of  
Section 13 B, it is indicated that:

"Personnel will be thoroughly trained and familiarized with all operational procedures

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1           and with pipeline equipment, and that a  
2           written startup procedure will be prepared  
3           and provided to personnel for each facility."

4       Now, is this part of the operations and maintenance  
5       manual that was referred to?

6           A      The startup procedure,  
7       Mr. Lucas, perhaps might be called a separable part.  
8       It's written for that single purpose of starting up  
9       the pipeline. There would be startup procedures  
10      manual sections for each compressor station, once  
11      the pipeline or a particular station is started that  
12      manual -- for the pipeline the manual is no longer  
13      required after that. There would be a new startup  
14      procedures manual for each new station as it's brought  
15      on the line.

16           Q      And will environment  
17      protection measures be written into the startup pro-  
18      cedures?

19           A      Yes sir.

20           Q      But at this stage you  
21      can't say precisely what they will be.

22           A      No. The manual itself  
23      can't be written until a lot of other information is  
24      available, for example, the details of the design of  
25      facilities is necessary before the manual can be  
26      written.

27           Q      So this won't be until  
28      after regulatory approvals?

29           A      That's correct.

30           Q      That is the writing of

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 the manual won't even start until following regulatory  
2 approvals?

3 A Oh, I'm sure that con-  
4 siderable of the work is available now which will go  
5 into the operations manual, so I would have to say  
6 that it probably has started now. It will be an evolv-  
7 ing thing and finally completed only when we know the  
8 details of the design of the system.

9 Q Mr. Hurd, in response  
10 to Mr. Hollingworth, I believe you indicated that  
11 turbine engines will be used at least fairly exten-  
12 sively in driving the compressor stations.

13 A Yes.

14 Q In the cooling and  
15 lubrication of these turbine engines, will synthetic  
16 lubricants such as Imol S-140 be used?

17 A The present plan is to  
18 use the synthetic lubricants only in the turbine end,  
19 the gas generator end of the equipment, not in the  
20 reaction turbine, nor in the compressor. Mr. Lucas,  
21 this subject can be dealt with much better by Mr.  
22 Carlson. I wonder if I might defer that question to  
23 him?

24 Q All right, Mr. Carlson,  
25 have your environmental advisors told you about the  
26 potential toxic qualities of these synthetic lubricants?

27 WITNESS CARLSON: I have not  
28 experienced any information of that type, although  
29 my previous company did use synthetic lubricants  
30 exclusively. We recognize that certainly there is

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

a toxic problem with synthetic lubricants.

Q      How are these substances going to be stored on the compressor station sites?

WITNESS HURD: There will be lubricant storage facilities -- the lubricant storage facilities are described in Section 8 B of -- generally they are steel tanks that -- for which in the case of -- steel tanks that are reliable containers and not subject to leakage. We recognize the hazards of synthetic lubricants.

Q Well, have you developed any special contingency procedures to deal with the event of spillage or leakage of these substances?

A We have discussed procedures for recovering spills which are fairly straightforward if it's a very large volume of material and I should emphasize that the synthetic lubricants are required in very small quantities at a station, and there would be no need to have large volumes of them on hand. So that spills of the synthetic lubricants on the station site would not likely be a difficult thing to deal with at all.

Q So you're not taking any special measures in their storage?

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1                   A     I'd have to say yes that  
2 we are, we are taking precautions to be sure that the  
3 tanks that they are stored in are reliable and not  
4 subject to leaking easily. They would be handled  
5 carefully.

6                   Q     That's no different than  
7 what you're doing in the case of the storage of  
8 petroleum substances, oil and gasoline and so on.

9                   A     We're handling those  
10 materials carefully also, yes.

11                  Q     Mr. Hurd, I'd like to  
12 refer you to question 22 in the responses to the  
13 Pipeline Application Assessment Group.

14                  THE COMMISSIONER: While you're  
15 finding that, Mr. Hurd, and Mr. Lucas, could I just  
16 interrupt and ask Mr. Fielder one or two questions to  
17 make sure what I understand what you said earlier,  
18 Mr. Fielder, about the Russian natural gas pipeline  
19 systems that you observed.

20                  Q     You can sit down for  
21 a minute, if you like, Mr Lucas. This might take me  
22 a moment or two.

23                  You said that there were  
24 three systems, first was the Yakutsk system. The first  
25 gas pipeline system the Russians built in the Arctic,  
26 and that according to your map, is in the region of  
27 Siberia called Yakutskaya and that is in what I  
28 suppose is Eastern Siberia?

29                  WITNESS FIELDER: That's  
30 correct, sir.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 Q That Yakutsk line was  
2 laid above-ground on supports and it is what, 221  
3 miles in length or 341?

4 A Sir, it's 256 miles in  
5 length, in total length, plus additions between  
6 Taas-Tumus and Pokrovsk and about -- excuse me,  
7 221 miles in length.

8 Q 221, yes, I follow you.  
9 A And about 120 of those  
10 miles are above ground on supports.

11 Q Well, what about the  
12 other 101 miles, was that buried or what?

13 A Sir, I just don't know.  
14 What you see in front of you there between the  
15 quotation marks was the only passage I could find  
16 in every report that I was able to dig into that dealt  
17 with that system.

18 Q Now, you say -- or the  
19 report says, I don't mean what you say but you say  
20 that it has been a useful testing ground for construc-  
21 tion techniques in permafrost, and that quotation is  
22 from the American Gas Association Report. Do you know  
23 anything more about it than that?

24 A Sir, I assume that what  
25 they meant, because this was the A.G.A. spent quite  
26 a lot of time looking at the Messoyakha and Norilsk  
27 line, and didn't visit the Yakutsk system. They quoted  
28 only what they were told by the Russians at that  
29 time, which was 1970, and I presume that what they  
30 meant was that after having built that line in the

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 vicinity of Yakutsk, the Soviets made whatever changes  
2 were necessary to improve the design and construction  
3 in the Messoyakha-Norilsk line. But I'd like to  
4 emphasize that that's just my opinion.

5 Q Well, I'm only asking  
6 you these questions because you seem certainly to know  
7 more about what is going on there than anyone else in  
8 this room. Perhaps not, but at least more than anyone  
9 else that's given evidence with the possible exception  
10 of Dr. Hardy; but he's gone now back --

11 A That's right.

12 Q -- to Calgary, and the  
13 -- well that was the first Russian line, and that was  
14 in Eastern Siberia, and I take it that it was built  
15 in permafrost, though I'm not entirely clear whether  
16 you're certain of that.

17 A Yes, I'm quite certain  
18 of that. Drs. Hardy, Morgenstern and Slusarchuk were  
19 all there at one time during that Permafrost Conference  
20 in 1973, and commented that it was ice-rich permafrost  
21 country. You could see polygonal patterns on the  
22 ground and hence knew that there were ice wedges in  
23 that area.

24 Q All right, that was a  
25 221-mile pipeline. Then you referred to the Messoyakha  
26 -Norilsk system which just looking at your diagram  
27 again is above the Arctic Circle and it is in Western  
28 Siberia and appears to be just east of that river that  
29 empties into the Arctic there. Do you know the name  
30 of that river or of that inlet?

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1                   A     The large inlet is the  
2 Ob River basin, spelled O-B.

3                   Q     yes, and that  
4 one, in your evidence you don't say how long that  
5 line is, the Messoyakha-Norilsk line.

6                   A     Yes sir, it's 265  
7 km. I didn't convert that to miles but I can do it  
8 quickly, if you like.

9                   Q     Well -- it would be about  
10 160 miles, would it? You don't have to convert it. .

11                  A     Just multiply it by  
12 .62 and that gives you your answer in miles, approxi-  
13 mately, sir.

14                  Q     Now that one, according  
15 to you, has three major and 80 minor stream crossings.  
16 This line was started in '67 and completed in '68.  
17 If that was in fact built through permafrost it would  
18 presumably -- there would presumably be a great deal  
19 of Russian experience connected with that line that  
20 it would be helpful to us to know something about.  
21 You say here -- not you, but this report says that  
22 that pipeline is pile-mounted.

23                  A     Yes sir.

24                  Q     And --

25                  A     Except for river crossings,  
26 the major river crossings.

27                  Q     Yes. Given the fact that  
28 it is entirely above the Arctic Circle, I suppose  
29 the presumption is that it was built through permafrost.  
30 Is that your understanding?

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

A Yes sir, I'm positive  
of that. Dr. Taylor visited with this group in the  
fall of 1973, and at that time he was working with  
Arctic Gas and I discussed the system with him after  
his return. I didn't go into -- I didn't quote his  
report environmentally here because I wasn't sure that  
he would feel that he has the credentials to be con-  
sidered an environmentalist, although the trip was  
certainly for that reason, that is to observe the  
after-effects of the construction of that line. Dr.  
Taylor's report does say something like the environ-  
mental after-affects are apparently very minimal. They  
saw nothing that indicated that there were serious  
problems even though the Soviets apparently designed  
and constructed the line with little concern for  
environmental matters. He pointed out in his report  
that their main concern was to make certain that they  
didn't interfere with caribou migrations, and hence  
periodically in the areas where they felt migration  
might be a problem, they increased the height of these  
lines above-ground to something like two meters in-  
stead of one, so the caribou could pass underneath  
it, and I believe they did mention that on occasion  
they buried the line or built it just barely below  
ground so that the caribou could go over it. This  
was just done for experimental purposes just to see  
how it would affect; and when I was in Russia we were  
shown a movie film of that particular system and the  
caribou coming up to it and passing under it and  
jumping over it and the like.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 Q This was a Russian movie?

2 A Yes, it was.

3 Q All right, so there have

4 been two pipelines, gas pipelines, one 221 miles in  
5 length, the other perhaps 160 miles in length, built  
6 in permafrost in Russia, and one in the mid-'60's and  
7 one in the late '60's, and both were built on piles.

8 You said the second one was built on piles. The first  
9 one, the Yakutsk line, was laid above ground on  
10 supports, is that the same thing as building on piles?

11 A Yes sir. The Yakutsk  
12 line was built partly on piles and partly not, and  
13 once again I can only presume that when they decided  
14 not to use the piles it was probably because either  
15 they were in an area that didn't contain permafrost  
16 or they were in an area in which the permafrost con-  
17 tained very little excess ice and hence they anticipated  
18 few problems.

19 Q Now, if you had -- by  
20 "you" I mean Arctic Gas and Northern Engineering --  
21 had opted to build on piles above ground, you wouldn't  
22 have had to face this question of chilling the gas  
23 so that when you buried the pipeline you wouldn't  
24 melt the permafrost. Do you know whether the Russians  
25 had considered that option, that is considered reject-  
26 ing the notion of building above-ground on piles,  
27 burying the pipeline, and chilling the gas so as to  
28 protect the permafrost? Do you know if they considered  
29 that?

30 A No sir, I don't know that.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1                   Q     Then you referred to the  
2     third system which you actually saw yourself, the  
3     Medverzhye system in Northwestern Siberia, in what  
4     I take it is a series of enormous gas fields that  
5     dwarf even Prudhoe Bay.

6                   A     Yes sir.

7                   Q     But that one wasn't  
8     built in permafrost. They were at pains to avoid  
9     permafrost, I take it.

1                   A     Generally speaking it  
2     was not built in permafrost. Occasionally they had to  
3     cross patches of permafrost, but as I understand it  
4     it was well-drained, frozen sand and hence they  
5     were not concerned about thawing it, in other words  
6     a thawed, well-drained frozen sand was not assumed to  
7     cause any kind of a subsidence problem and indeed it  
8     has not.

9                   Q     They were not pressing  
10   through ice-rich soils?

11                  A     Quite correct.

12                  Q     So that the Russians  
13   faced the problem of logistics in these wilderness areas,  
14   they faced the problem of the cold and the darkness. In  
15   the Yakutsk system when they built that and in the  
16   Messooyakha-Norilsk system they faced the problem of  
17   the permafrost, but they decided to avoid it by simply  
18   building on piles above the permafrost, so that their  
19   solution they opted for was quite the opposite almost  
20   of the solution you opted for. Is that why you say  
21   at the end that there is not a great deal we can learn  
22   from their technology?

23                  A     Sir, I think that if  
24   we had decided for some reason or other to build  
25   our pipeline on piles, we would probably want to take  
26   advantage more of what we see in Alaska today than  
27   what the Russians have done, and I say this only because  
28   the reports that I read suggest that the Soviet  
29   pile system leaves something to be desired.

30                  Q     In terms of what -- you said

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 the environmental damage was minimal according to  
2 Dr. Taylor, what --

3 A Just the quality of the  
4 pile system themselves, -- many of them had to be  
5 replaced. I do not know for what reason and I hesitate  
6 to guess in an area such as that, but I gather that  
7 as they gained experience with the use of piles they  
8 improved their pile design and some of the earlier  
9 ones, the first line out of Messoyakha- Norilsk, for  
10 example, was described as being, I think, disastrous  
11 was the word, so I think we would be more inclined  
12 to utilize the technology that is available to us  
13 from Alyeska right now should we decide to go that  
14 route. The Russians certainly cannot help us when  
15 it comes to the chilled gas problem because they have  
16 not faced it and --

17 Q Well --

18 A -- are not.

19 Q Well, the Alyeska line  
20 cannot help you with the chilled gas because that is  
21 oil and it is being carried -- well, partly above  
22 ground and partly below ground as I understand it?

23 A That is correct.

24 Q And the permafrost areas  
25 in the Trans- Alaska line, there they are carrying oil  
26 above ground on piles only burying the pipe once they  
27 have gotten south of the permafrost zone. That is what  
28 they are doing, isn't it?

29 A If not that, burying it  
30 only when they can bury the line in ice free frozen

1 | gravels.

Q So that you say the terms  
considering the option of going  
one, you would expect the  
Alyeska in Alaska to be  
you than the technology of the  
and Messoyakha-Norilsk lines?

1 certainly they have been taken into account by reading  
2 and studying to make certain that we take an advantage  
3 of everything they can teach us in that respect.

4 We had hoped that we would be  
5 able to learn something by seeing them actually  
6 constructing a pipeline in permafrost and thought that  
7 that would be an area which they have done some things  
8 that we have not, but unfortunately, we were not  
9 even able to do that and if we had we would have  
10 seen them ditching frozen ground much like, as I say,  
11 ditching frozen ground in northern Alberta today, so  
12 once again there was very little to learn.

13 Q So what it comes down  
14 to is this, the Russians built two pipelines in the  
15 sixties in permafrost, two gas pipelines, but they  
16 built them on piles above the permafrost so that  
17 it would only be if you were building a gas pipeline  
18 on piles that you might learn something from their  
19 experience and you say that the more recent experience  
20 of Alyeska in building its oil pipeline on piles  
21 from Prudhoe Bay south to the end of the permafrost  
22 zone would be more valuable to you, that is really  
23 where we are at, is it?

24 A That is my opinion, yes,  
25 sir. The one thing the Russians have done that we  
26 have not done yet in a massive scheme like this is  
27 to utilize a river system for logistical purposes and  
28 the Ob River is navigable for most of its length and  
29 they built wharves at the appropriate spots just  
30 like we plan to do. They were blessed by being able

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 to build their wharfs in non-permafrost areas where  
2 we will not , but nonetheless that experience tells  
3 us if nothing else that if you decide to do it and  
4 put your resources to it , you can get it done.

5 Q I -- what about Dr.  
6 Taylor, where is he now?

7 A Dr. Taylor has a consulting  
8 practice of his own in Calgary, sir.

9 Q Well, would he be the  
10 most knowledgeable man in this field, I mean, the  
11 most knowledgeable man working in Canada with knowledge  
12 of the Russian systems?

13 A I hesitate to say that,  
14 he probably would not forgive me if I did.  
15 Dr. Taylor is a geologist and he has made at least one  
16 other trip to Russia. I do not believe that it had  
17 anything to do with pipelines, but I may be wrong. I  
18 know he saw this Messoyakha-Norilsk system. I do not  
19 believe he saw any of the other systems. He is  
20 familiar with what Arctic Gas's plans are, because, as  
21 I say, he did work with us for a period of time. I  
22 just do not know whether he would be the most knowledgeable  
23 or not. I would think that to find the most knowledgeable  
24 person in that respect, you might want to talk to someone  
25 in industry, trade and commerce in Ottawa, like Mr.  
26 Chiperzack who seems to host most of these  
27 groups for Canada and he would be able to point us  
28 towards the most knowledgeable person.

29 Q Yes, I was just wondering  
30 if they had considered chilling -- burying the pipe,

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

chilling the gas to protect the permafrost and had anticipated the problem of frost heave.

A Sir, since the Canadians have been visiting with the Russians and the Russians here in Canada, they have certainly become exposed and knowledgeable to our plans for using a chilled gas pipeline and the cost of chilling is certainly not cheap, it is very, very expensive and as their permafrost appears to not be as severe as ours, I would suspect that they have taken the most economical course to them, which we don't think is the most economical course as far as we are concerned.

Q Yes, well, thank you very much, Mr. Fielder. I am sorry to have interrupted you. I should say that I think we will carry on until 5:30 at the very least today and those whose commitments to watch the hockey game require them to leave early we'll just have to function without them. I should say for the benefit of counsel that Mr. Anthony on behalf of Canadian Arctic Resources Committee made a motion about the taking of evidence regarding alternate routes at the conclusion of phase one and I intend to give my ruling on that subject tomorrow.

So, carry on, Mr. Lucas.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

MR. LUCAS: Thank you, Mr.

Commissioner. Mr. Anthony has been waiting with great expectations. He's be very pleased to hear that, I'm sure.

Q Now, Mr. Hurd, I referred you to question 22 in the responses to the Pipeline Application Assessment Group, especially on page 22-4, where you have set out an illustrative situation in which a break has occurred at a particular spot on the North Slope, on the Prudhoe Bay lateral. Now would you also refer to one of the route maps in Section 13 A, because I'm going to give you a slightly different hypothetical situation and ask for your explanation as to how the contingency would be handled. So the map is 1 C-0211-1001, and that's the -- it covers approximately Milepost 240 to -- this is on the Prudhoe Bay lateral.

WITNESS HURD:  
Yes.

Q Do you have those references, Mr. Hurd?

A Yes.

Q All right, I'd like to ask you to assume that a break occurs in the vicinity of Milepost 290 on the Prudhoe Bay lateral, and that would be between compressor station CA-06 and CA-07. Now, I would ask you further to assume that it occurs during the period August 15th to October 1st, in the late summer but prior to freezeup. Now, during this period, snow geese are staging on the North Slope of Alaska in the vicinity of the assumed break in preparation for the flight south.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1                   Mr. Lucas?

2                   Q      On the North Slope of  
3                   Canada, in the area of the assumed break. Now, I would  
4                   like you to run through the sequence of activities that  
5                   would take place to deal with a break in that area at  
6                   that time.

7                   A      Each of the contingency  
8                   plans, Mr. Lucas, for such an event is a study in it-  
9                   self, and a lot of work would go into developing the  
10                  plan for a break that occurred in that area. We can  
11                  touch on the major parts of such a plan that would  
12                  be developed. It wouldn't be in the same detail, I  
13                  don't think, that you found in question -- the response  
14                  to question 22.2, nor in the same detail that appears  
15                  in a similar description in 13 B.

16                  Q      So you would develop a  
17                  separate contingency plan for each area?

18                  A      That's correct, yes.

19                  Q      How large would each  
20                  area be?

21                  A      They would vary. It  
22                  would depend on the circumstances or the physical  
23                  setup where the river crossings are, where equipment  
24                  is, where major air strips are, the type of terrain  
25                  that we would cross, whether there are potential  
26                  environmental disturbances at certain times of the  
27                  year, as this one would have.

28                  Q      So you can't tell us  
29                  which areas will have    separate contingency plans.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

WITNESS FIELDER: Could I help  
a little bit in that respect? / would normally be  
from the compressor station closest to it, providing  
that river crossings were not a particular problem.  
So as one basis we would consider preparing contingency  
plans for sections between compressor stations, having  
set out prior to the time that the break occurred by  
means of this plan how access to any particular part  
of the line would be carried out.

With a separate plan being prepared for different seasons of the year, so we would know that if a break occurred at a particular time, that we'd use other aircraft or low ground pressure vehicles, whether there was an A.C.V. in the vicinity or whatever, and also of course taking into account the environmental considerations that you suggested. But that has not been done at this moment.

Q You will not have those specific plans until after final design, and after regulatory approvals?

A Until after regulatory approvals, certainly they will be developed as final design is being developed, and this is because the contingency plans will depend upon the types of equipment we have available to us, and we won't want to select that equipment until the last necessary moment so that we make certain we take advantage of the most up-to-date equipment available to us.

Q And that means you can't really develop these plans until the last moment in

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 anticipation of improved technology?

2 A yes sir, the last  
3 necessary moment.

4 Q Well, Mr. Fielder, Mr.  
5 Hurd, I don't want to lose the scenario I've developed,  
6 so I'd like to ask you about that situation, Milepost  
7 290 in the late summer-early fall. Would you anti-  
8 cipate using aricraft to deal with a break in that  
9 area and at that time?

10 A Sir, that would depend  
11 upon the necessity to get across the rivers. You've  
12 chosen the break between the Babbage River and the  
13 creek-- I don't know the name of the river that's  
14 very close to Milepost 310; but at any rate if that  
15 river could be forded with the L.G.P. equipment that  
16 we have available at CA-07, or alternatively, if the  
17 river on the other side can be forded from CA-06, it  
18 should not be necessary to access the site by air-  
19 craft; but certainly we would have to cross those  
20 river in some way, shape or form.

21 Now, once the break was  
22 reported, all we would know at our Gas Control Centre  
23 is that a break occurred between CA-06 and CA-07. We  
24 wouldn't know precisely the location of the break, and  
25 at that time we would have to send an aircraft out  
26 over the site to locate the break specifically; and  
27 contingency  
28 after that the plan had been organized, and incidentally  
29 been organized in conjunction with the land use  
30 people so that we can react quickly -- and I say this  
assuming that we can put together such a plan in

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 conjunction with those people to allow a very quick  
2 reaction to an emergency situation. Once that's been  
3 done, they would be notified and the contingency plan,  
4 whatever it is, would be put into effect.

5 Q Could you deal with the  
6 situation that I've outlined without using aircraft at  
7 all?

8 A We could but we would be  
9 out of service for considerably longer, so that we  
10 <sup>we</sup> at the very least would want to locate the site of the  
11 break, using either a helicopter or a fixedwing air-  
12 craft. But certainly if we had to do it without it,  
13 we could do it. It would just take longer.

14 Once again, sir, that presumes  
15 that we can ford those rivers.

16 Q All right, so far as  
17 aircraft use is concerned, in the biological report  
18 series -- and I'm referring to Volume 14, chapter 7,  
19 it's a paper by R.E. Swinesberg entitled:

20 "Snow Geese Disturbance by Aircraft on the  
21 North Slope, September , 1972,"  
22 at page 277, and I'd like to quote one of the recommen-  
23 dations made by this Arctic Gas environmental consul-  
24 tant. It's recommendation No. 7 on page 277:

25 "Because of the sensitivity of geese to aircraft  
26 disturbance, flights should be curtailed over  
27 the pre-migratory staging areas between August  
28 15th and September 30th, and necessary over-  
29 flights during this time should avoid areas of  
30 heavy snow geese concentration."

1 Now, would you be prepared to accept the constraint of  
2 that recommendation in developing your contingency plan  
3 for this particular area?

4 A Certainly not happily.

5 WITNESS HURD: I wonder if I  
6 could ask a question of Mr. Lucas? Is there -- having  
7 not read that for a good long time, is there  
8 another recommendation having to do with the altitude  
9 which small aircraft may fly in the same area?

10 Q Not in this particular  
11 report, Mr. Hurd.

12 A The answer may be in that,  
13 that small aircraft flying high enough will not disturb  
14 the snow geese. If the break is major it can be seen from  
15 a good high altitude so there may be ways without using the  
16 extra time that Mr. Fielder was talking about to do it  
17 without aircraft. There may be ways of flying over the  
18 pipeline route and finding the location of the break  
19 without disturbing the snow geese.

20 Q Let me put the question a  
21 little more generally. In developing your contingency  
22 plans for particular areas, are you prepared to accept the  
23 recommendations made by your environmental consultants.

24 MR. MARSHALL: I have a lot of  
25 difficulty with a question that is that general, Mr.  
Lucas. It would seem to me that in the recommendation  
itself it talked about two things. It talked about trying  
not to have over flights, but if you did have over flights,  
try to avoid areas of concentration so it would seem to me  
there are probably two things in that one recommendation  
itself. The question you put is of such a general nature I  
don't know how the witnesses can possibly answer it.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 Q Well, I refer --

2 Mr. Commissioner, I refer specifically then to this  
3 recommendation in your contingency plan, are you pre-  
4 pared to accept the recommendation of your environ-  
5 mental consultant that I've quoted?

6 WITNESS FIELDER: We are  
7 prepared to consider that recommendation just like  
8 we consider every recommendation; but it would have  
9 to be weighed in the light of the whole problem. One  
10 of the problems is -- the problems are that the  
11 pipeline must be put back together again in the  
12 shortest possible time.

13 Q So you can't say at  
14 present whether you could accept that recommendation  
15 as part of the contingency plan?

16 A I certainly accept it  
17 as a recommendation, yes.

18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 Q But you can't say whether  
2 you would be prepared to incorporate it into any contin-  
3 gency plan developed for this particular area?

4 A Sir, that wouldn't be  
5 a decision that I would make.

6 Q So, we're into a policy  
7 decision again? Okay, I will note that for Mr. Horte  
8 as well.

9 MR. SCOTT: Mr. Commissioner,  
10 was it established that this was a policy matter for .  
11 Mr. Horte? Mr. Lucas said that.

12 THE COMMISSIONER: Yes, I  
13 know he said that.

14 MR. SCOTT: I'd like to hear  
15 from Mr. Marshall, because it seems to me that this is  
16 precisely the kind of question that somebody should be  
17 answering, and if it isn't with this panel I'd like  
18 an assurance.

19 THE COMMISSIONER: Well are  
20 we being all together too clever about all of this. If  
21 you have a break at Milepost 290 or whatever it is, and  
22 the snow geese are staging nearby. And there is no  
23 other way of getting in there to repair the break except  
24 by using aircraft that will fly so low that they will  
25 disturb the snow geese, then once this pipeline is built  
26 whoever is running this thing, whether it is Arctic Gas  
27 or the Federal Government, that is whoever is responsible  
28 for deciding what you are going to do, is confronted with  
29 the question, well do we just forget about repairing the  
30 break and not go in until the snow geese have left?

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 Now, is that something you say Mr. Lucas, can be laid  
2 down in a manual in advance, or is it something which  
3 in the nature of things, a decision that is going to be  
4 made at the time, and on the spot, and perhaps hurriedly ?  
5 It's a problem and I appreciate your tackling it from  
6 the end -- from your end, but is it something these  
7 gentlemen can answer? I am certainly willing to let  
8 them try, or is something that this Inquiry really has  
9 to sort and make recommendations so that it can be dealt  
10 with in a practical way?

11 You can have all  
12 the most refined provisions in the contingency plan, but  
13 it may well be that when the break occurs on the spot,  
14 someone will say "let's fly a Hercules in there, and get  
15 that thing repaired". That's what we are dealing here,  
16 and certainly you carry on and tackle it from your end.  
17 Sooner or later we'll get to the other end of those  
18 questions; how is this going to be handled at the time.  
19 I know that later on in the Inquiry you will have plenty  
20 to say about that.

21 MR. LUCAS: Well, Mr.  
22 Commissioner, I am not attempting to plumb the depths  
23 with these gentlemen to try to discover how detailed and  
24 sophisticated and complex the contingency plans really  
25 are. What I am trying to find out is whether there really  
26 are any contingency plans.

27 THE COMMISSIONER: Well, that you  
28 certainly can try and find out.

29 MR. LUCAS: I am making slow  
30 progress in that regard Mr. Commissioner.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 MR. SCOTT: Mr. Commissioner,

2 respectfully also, there is one other question inherent  
3 in Mr. Lucas' question before we get to the different  
4 scenario that you put, in which there are no alternatives  
5 except to go in with a Hercules or leave the pipe broken  
6 for four months. And the second possibility is that there  
7 will be a commitment by Arctic Gas to develop contingency  
8 plans in which precisely that kind of recommendation is  
9 acted upon.

10 As Mr. Marshall points out

11 it doesn't preclude flights, it specifically contemplates  
12 the kind of flight and areas to be avoided and so on and  
13 so forth. My concern is to support Mr. Lucas and determine  
14 from whom we may ask the questions as to whether those  
15 recommendations are going to be accepted and acted upon.  
16 I can understand if this panel says, "well, that's a  
17 question of policy, we can't answer questions like that"  
18 On the other hand, if Mr. Horte can I'd like to have  
19 the assurance that he will be able to do so. It may  
20 be something for Phase 3, in fact, rather than Phase 1.

21 WITNESS FIELDER: I'm sorry,

22 I didn't say it was a matter of policy and I didn't  
23 intend to.

24 THE COMMISSIONER: Well, Mr.

25 Lucas, you carry on. I only interrupted you because I  
26 was in a sense thinking out loud about the ramifications  
27 of the question you were asking, and they are good questions,  
28 and important questions, and I just wanted to make sure  
29 we all understood how good they were before you carried  
on with them.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1                           A     May I add another thing  
2     Mr. Lucas, to my last comment? What I meant when I said  
3     that it was not a decision for me to make, I meant that  
4     it wasn't a decision for me to make in isolation, and that  
5     we would certainly accept the recommendation of Mr.  
6     Schweinsburg, but there are other people who make  
7     recommendations as well. I suspect someone who's perhaps  
8     more interested in mammal life than bird life, might  
9     be concerned about a hole being left in the ground where  
10    animals could harm if they fell into it for example.  
11    And would be just as anxious as we are to see that hole  
12    repaired, and hence we would need to take into account  
13    the recommendations of everyone, and they are not always  
14    the same recommendations. Quite often they are opposed.  
15    And then decide how the situation would best be faced.

16                          All I meant to point out to  
17    you is that we would take the side of the people who  
18    wanted to get the line repaired quickly, because that  
19    of course is one of prime considerations.

20                          MR. LUCAS Q: Mr. Fielder,  
21    Mr. Hurd, just picking up on something that I think  
22    Mr. Scott said a few moments ago. To pull back a little  
23    from the worst case situation that I think was suggested  
24    by the Commissioner, I would like to quote a passage  
25    from the Alaskan Arctic Gas application. From the  
26    volume entitled " Environmental Report", and under the  
27    heading "Monitoring and Preventive Measures, at page 17,  
28    and I quote --

29                          THE COMMISSIONER: Excuse me,  
Arctic  
30    this is the Alaskan/Gas application to the F.P.C.?

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 MR. LUCAS: Yes, sir.

2 Q I quote, " because of  
3 the sensitivity of snow geese to aircraft disturbance,  
4 flights will be curtailed over the pre-migratory staging  
5 areas between August 15th, and September 30th. Necessary  
6 overflights during this time will maintain a 1000 foot  
7 minimum altitude and will avoid areas of heavy snow  
8 goose concentration."

9 Now, is Canadian Arctic Gas  
10 willing in terms of it's contingency plans at present  
11 to make the same committment that the sister company,  
12 Alaskan Arctic Gas has made in its application?

13 WITNESS HURD: A The  
14 phrasing there has the qualification that I wondered  
15 about earlier, and that committment, yes, Mr. Lucas, we  
16 would make that.

17 Q So, you are prepared  
18 to give us in Canada the same committment that you give  
19 the American people in that regard?

20 A Yes. It is a more  
21 reasonable condition to apply on the operating practices.  
22 You see, it allows flights above a thousand feet. At  
23 that elevation a major break could be seen.  
24 As Mr. Fielder explained the first purpose of flying over  
25 the area would be to determine where the break is. From  
26 that point on the repairs could be carried out on the  
27 ground.

28 THE COMMISSIONER: Could  
29 I just ask -- You are assuming a break could be seen  
30 from a thousand feet in the air. That would be what I

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 think was described as a longitudinal rupture of the  
2 line that might extend for -- I've forgotten the  
3 lengths that were given to us, but perhaps hundreds of  
4 feet. Is that the kind of rupture you had in mind?

5 A I wasn't -- I didn't  
6 have in mind a break quite that large sir. One large  
7 enough that it could be detected at the compressor  
8 stations on either side of the break, by changes in  
9 flow rates and pressure levels.

10 Q Oh, there's no doubt.  
11 about that. The people at the compressor stations will  
12 understand that something was amiss. I was -- when we  
13 had the design panel here, there was a good deal of  
14 discussion about this subject. You may have been here,  
15 and heard what was said then. My impression was that  
16 a tendency, if a break occurred in this line, would be  
17 for it to rupture longitudinally. The suggestion was  
18 made that that rupture could extend for hundreds of  
19 feet. There was a gentleman who discussed that at  
20 length; his name, forgive me I can't remember, but  
21 everyone else will remember.

22 MR. MARSHALL: Mr. Holmberg.

23 THE COMMISSIONER: Mr. Holmberg,  
24 yes. I was going to say, Mr. Homer, but it's Mr.  
25 Holmberg. That was the purport of his evidence, and if  
26 you're not thinking of a rupture of that nature, what  
27 kind of a rupture are you thinking of?

1 A ANY rupture large enough  
2 to allow a reasonable percentage of the total gas  
3 flow to escape.

4 Q Yes --

5 A So that it could be  
6 detected at stations on either side of the break,  
7 would release enough gas and disturb the surface over  
8 the pipeline enough in my view that it could be  
9 seen from 1,000 feet.

10 Q Well, a break that  
11 would disturb six feet of earth cover in an area  
12 large enough to be seen from the air, that would be  
13 a break that if the pipeline were above ground,  
14 would -- well, even if it were not above ground, that  
15 would be a break of real significance. It would be a  
16 break of the type, wouldn't it, that Mr. Holmberg  
17 discussed even if it did not extend for hundreds of  
18 feet?

19 A Yes.

20 Q See, as I understood  
21 it, he said that if you got a fault or a flaw that --  
22 or if there is some exterior cause, some exterior force  
23 were applied, once it occurred, even if it were over  
24 a very limited area of the pipeline, of the steel,  
25 the tendency would be for it to progress longitudinally  
26 and almost instantly for hundreds of feet. That --  
27 I am recasting his evidence in a very rough fashion,  
28 but that impression was left with me. I have in  
29 mind what you have said and what everyone else has  
30 said that these things are very remote possibilities and

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 so forth, but if all of that is occurring under the  
2 ground, then you say it can be observed from the  
3 air. I should think it could be.

4 Well, forgive me, I seem  
5 to be doing most of the talking this afternoon, but  
6 then, I am entitled to it now and again.

7 MR. LUCAS: Thank you, sir,  
8 I am almost finished with these gentlemen.

9 Q Still with environmental

10 conditions regarding aircraft flight. Mr. Hurd, as  
11 part of the operations and maintenance plan, as part  
12 of the contingency plans for particular areas that  
13 you mentioned, have you established rules regarding  
14 flight altitudes and flight corridors for particular  
15 areas of the route?

16 A Again, Mr. Lucas, these would  
17 be, those questions would be a part of the operations  
18 manual. We can say general things about them now  
19 as we have in testimony up to now, things like, while  
20 it is desirable to do the pipeline patrol at perhaps  
21 100 to 150 feet which is quite low, in areas where there  
22 is potential disturbance to staging migratory birds,  
23 for example, or caribou, the patrol flights could be  
24 done at higher altitudes and then areas which needed  
25 a more careful check could be spot checked at that one  
26 area. The specifics would have to be part of that  
27 operations manual.

28 Q But specifics will be  
29 developed --

A Yes, sir --

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 Q -- in terms of altitude and  
2 flight corridors?

3 A Yes, and times of the  
4 year.

5 Q And they will be developed  
6 in consultation with your environmental consultants?

7 A Yes, sir.

8 Q But this won't be  
9 done, or it won't be finalized until after regulatory  
10 approvals?

11 A The total operations  
12 plan cannot be done until then.

13 Q Excuse me, -- operations manual  
14 is a better term. It can't be done until then.

15 Q Thank you, I appreciate  
16 your general answer even though Mr. Marshall won't  
17 let me ask any general questions.

18 MR. MARSHALL: Help yourself.

19 MR. LUCAS:

20 Q Mr. Hurd, in Section 13-B  
21 at page 25, reference is made to regular tests of  
22 sewage effluent that will be conducted to insure  
23 compliance with Government water standards. Do you  
24 have that passage?

25 A Yes.

26 Q Now, what are these  
27 Government water standards, Mr. Hurd?

28 A Mr. Lucas, I cannot answer  
29 that one in detail that might be useful. I am aware that

Fielder, Hurd, Carlson  
Cross-Exam by Lucas

1 there are standards and whatever those standards are  
2 they will be met.

3 Q So the Government water  
4 standards are whatever the Government tells you to  
5 do?

6 A That was the intent of  
7 the remark, yes, sir.

8 Q And this presumably has  
9 been taken into account in developing the operations  
10 and maintenance plan?

11 A Yes.

12 MR. LUCAS: Thank you. Those  
13 are all the questions that I have, sir.

14 THE COMMISSIONER: Excuse me,  
15 where was that reference to water standards? Page  
16 what?

17 MR. LUCAS: It was page 25,  
18 I believe.

19 THE COMMISSIONER: On that  
20 page 25, I just do not see it -- under waste,  
21 disposal and water treatment?

22 MR. LUCAS: Yes, sir, it is  
23 the second paragraph under the heading "Waste Disposal."

24 THE COMMISSIONER: Oh, yes, right.

25 MR. LUCAS: "Compliance with Govern-  
26 ment water standards."

27 THE COMMISSIONER: All right.

28 MR. SCOTT: Mr. Commissioner,  
29 I wonder if I could put a question to Mr. Marshall  
30 that might save some time. Mr. Lucas I think fairly

1 graphically has -- and fairly directly, I may say to be  
2 fair -- has got the panel to agree that they will  
3 accept a constraint contained in the American application,  
4 as being applicable in Canada. It is a constraint that  
5 stipulates as to how low planes may fly under certain  
6 conditions at the staging ground. That no doubt is  
7 useful because it advances us slightly beyond the  
8 form of our application here. I wonder if Mr. Marshall  
9 can tell us whether the other constraints that are  
10 contained in those -- in that application will also  
11 be accepted here or if we must go through them one  
12 by one to determine whether the environmental concerns  
13 in Canada are going to be treated differently than  
14 they are in Alaska. I do not expect him to answer  
15 now, if he doesn't want to.

16 MR. MARSHALL: To begin with,

17 Mr. Scott, I am just not certain at this point whether  
18 or not 14-C, exhibit 57 contains the same limitation  
19 in Canada, I would have to check. I don't know  
20 whether or not there are parallels throughout the  
21 two applications. It is just something that we would  
22 have to check and I can advise you on it -- after I  
23 have checked and I have got some instructions.

24 MR. SCOTT: Well, I don't want the

25 advice particularly on this issue of the snow geese. I  
26 am much more concerned, if I may put it this way,  
27 about the general question. It may be that in drafting  
28 the application to the American authority it has been  
29 considered too politic to be more precise about constraints  
30 that the applicant is prepared to accept and live with.

I think it would be a misfortune if the applicant here, assuming they were appropriate, was not prepared to openly accept them for the Canadian environment as well.

MR. MARSHALL: Mr. Scott, as you indicated, it is something on which I cannot give you an answer now. I will have to check to see whether or not there are circumstances such as you have postulated and I will get instructions and I will advise you in due course.

WITNESS HURD:

A Mr. Marshall, may I elaborate just a bit. The intent of the answer to that very specific question was to recognize that snow geese do not have a nationality really, and an environmental concern in Alaska because of snow geese staging very close to the pipeline route is similar concern in Canada if they are staging very close to the route. So it is easy enough to agree that a constraint that is reasonable in Alaska because of snow geese close to the pipeline is a proper constraint to apply in Canada for the same reason.

As far as agreeing in a general way that all constraints or conditions volunteered by Alaskan Arctic in its application to the Federal Power Commission, if -- it wouldn't be so easy to agree without checking each of them that the same constraints ought to apply in Canada.

MR. SCOTT: Well, I would ask, Mr. Commissioner, if Mr. Marshall could check each of them. The point I make and I make no

Fielder, Hurd, Carlson  
Cross-Exam by Lucas  
Cross-Exam by Bayly

1 criticism of the panel, was that Mr. Lucas was having  
2 a good deal of difficulty getting any precision at all  
3 whatever at all from the panel, until he read a portion  
4 of the application made in the United States whereupon  
5 the panel said, "yes, they'd accept that." Well, if  
6 he had not read that, we would be no further ahead than  
7 we were before. Now we are substantially further ahead  
8 because that has been done. I hope Mr. Marshall would  
9 have an opportunity to check that and see the appropriate  
10 cases in which the constraints accepted in the United  
11 States can be accepted here as well.

12 THE COMMISSIONER: Well,  
13 he says he will do that -- we can rely upon him.

14 CROSS-EXAMINATION BY MR. BAYLY:

15 Mr. Commissioner, to follow  
16 up the point that Mr. Scott has just raised, I am  
17 wondering as well whether Mr. Hurd speaks at this point  
18 for Arctic Gas or as an employee of Arctic Gas and  
19 this would have to be confirmed, that is --

20 THE COMMISSIONER: Well, I  
21 think what we will do is this. Mr. Hurd has spoken  
22 today and we will take it that he speaks for Arctic  
23 Gas unless somebody comes along and says later on that  
24 he did not. I think that we can proceed in that way.  
25 So the burden is on Arctic Gas to disavow, not on you to  
26 insure that he in fact has authority to say what  
27 he said.

28 MR. BAYLY: Thank you, sir.

29 Q Mr. Hurd, if we might just  
30 continue with this scenario before I get on to what I  
prepared as my cross-examination, referring to drawing  
1C-0211-1001 again.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

Have you that drawing, sir? It's somewhere near the end of 13-A.2.2, if that's any help. Perhaps to save time I could bring you one and borrow Mr. Hollingworth's. What I'm referring to in this diagram is your references in the scenario that Mr. Lucas provided, to flights over the pipeline area in which there is some sort of a breakdown or rupture. You have stated that you would be willing, as much as possible, to follow those undertakings that have been made by Alaskan Arctic Gas as to the height over which you would fly if you could see the break at this point. Now, the rules that you would set internally in your -- and put out in your manual for operations and maintenance, would I gather provide that flights shall be at least 1,000 feet during this period of time in this kind of area, would that be correct to assume?

A That sort of thing,  
yes, Mr. Bayly.

Q Now, because flights aren't entirely governed by Arctic Gas, I would assume that at some point you have or will have to approach the Ministry of Transport to find out if that fits in with their kinds of regulations. Would that be fair to say?

A \* If I understand, Mr. Bayly, you are referring to air space which is controlled by -- which is called controlled air space?

Q Yes.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 A And the M.O.T. assigns  
2 altitudes and so on?

3 Q That's the reference I'm  
4 making, yes.

5 A Certainly we would  
6 comply with those regulations or assignments also.

7 Q So when you are preparing  
8 your manual you would have to take that into consider-  
9 ation?

10 A Yes.

11 Q And in this area, that  
12 is the area where Mr. Lucas has proposed that there  
13 may be some sort of a break, you would also, I assume,  
14 have to check with the Pentagon, since this is very  
15 close to a Dew Line site, and they also have controlled  
16 air space in this area, is that correct?

17 A Not to my knowledge,  
18 Mr. Bayly. I am aware of many flights that have been  
19 made before now over the same area, and I was not aware  
20 of any check having been made with the Pentagon.

21 Q All right, I don't mean  
22 that you would have to check each flight with them, but  
23 I am suggesting that you would have to, if you were  
24 devising some sort of operation and maintenance scheme  
25 in the area of a Dew Line site, have to check with  
26 them to see what their rules were, the same way you  
27 would have to check with the Ministry of Transport.

28 A Certainly we would make  
29 ourselves aware of what regulations, if any, or what  
30 authority, if any, the operator of the Dew Line sites

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

had in those areas. If that exposed some conflict with our own wishes or with the Ministry of Transport regulations, we would have to find some way of resolving that.

Q All right. Has any sort of work in this area been done by the operations and maintenance people, or is this something that still has to be done before your manual can be prepared?

A It would have to be done to finally prepare the manual.

Q Now getting away a bit from the area of breaks, but just into the area of general maintenance, I assume that you would be considering, as you have said in your 13-B portion of the application, that flights over the pipeline right-of-way at regular intervals would have to be made, is that correct?

A We would propose line patrol flights, yes sir.

Q And again you would have to check with the Ministry of Transport to see whether the operations rules for aircraft that you would propose fit in with any of their controlled air space regulations; would that be correct as well?

A We would make that check before the plan for scheduled line patrol flights was established?

Q But I take it that no such check has been made so far to see whether or not your proposals on the general basis that they have

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1      been put forward in the application are in conflict  
2      at the present time?

3                  A      I'm not aware of a  
4      specific check, Mr Bayly. That doesn't mean that one  
5      hasn't been made.      I'm not aware that its con-  
6      trolled air space in that area either.

7                  Q      All right. My concern is  
8      that you may decide you want to avoid a certain area  
9      on a certain day because there is perhaps a herd of  
10     caribou, and when you file your flight plan with  
11     the Ministry of Transport they say, "I'm sorry, some-  
12     body else has already filed<sup>at</sup> that altitude that way,  
13     you will have to fly a different way." Do you envisage  
14     that as a possibility, that it may hamper your doing  
15     things strictly according to your manual?

16                A      I can imagine that that  
17     may very well happen. It wouldn't be a serious thing  
18     in the operations of the line because such line  
19     patrols can be re-scheduled and are flexible.

20                Q      Without committing your-  
21     self to a general policy, would you envisage re-  
22     scheduling as a solution to this problem on a sort of  
23     week to week basis, if these things arose when you  
24     were going to do a patrol?

25                A      A very easy solution,  
26     yes sir.

27                Q      All right. Now if I  
28     could have my volume back, because I've got some notes  
29     in it, I refer you to page 6 of the operations and  
30     maintenance portion under the general heading,

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1           "Organizational structure,"

2       and with specific reference to the second paragraph  
3       in divisions and districts. Now you refer in that  
4       second paragraph -- and I'll read the sentence:

5           "The applicant plans to hire northern residents  
6       to fill its full-time personnel requirements to  
7       the greatest extent possible."

8       Now, as operations and maintenance people, have you  
9       developed any kind of scheme or guideline for how  
10      you will be able to implement this statement in 13-B?

11           A      I'm not sure I under-  
12       stand, Mr. Bayly, what you mean by "scheme or guide-  
13       line", beyond saying that to the greatest extent that's  
14       possible and practical, it is our intention to hire  
15       northern people. That's not an unusual practice for  
16       operating pipeline companies. Traditionally they,  
17       to the greatest extent practical, find their permanent  
18       full-time staff in the area in which they're operating.

19           Q      Now when you say "local  
20       people" would you envisage designing certain programs  
21       to suit the educational problem specifically of native  
22       peoples in the area through which the pipeline route  
23       goes?

24           A      Yes indeed, sir.

25           Q      Now, you go on in that  
26       paragraph to say that:

27           "Important influences on the pipeline's full-  
28       time personnel requirements will be the success  
29       of recruitment and training programs designed  
30       to attract local residents, the productivity

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 and turnover of personnel, the availability of  
2 contractor and supplier personnel, and the length  
3 of time required for individuals to become  
4 skilled in more than one basic technical dis-  
5 cipline,"

6 and the sentence goes on,

7 "as is required on operating pipeline systems."

8 Now, have you designed a scheme of recruitment at this  
9 stage which you feel would be successful? Or is that  
10 something that would have to come at a later stage?

11 A It probably will, Mr.  
12 Bayly, have to be at a later stage for a number of  
13 reasons. Our training program has been under way  
14 or the training program that we administer has been  
15 under way for three years now, and so far is quite  
16 successful. When the time comes to staff the  
17 operating pipeline, the situation may be very different  
18 then than what it is now. We will be competing at  
19 that time with other employers for a very limited  
20 pool of potential operating and maintenance personnel.

22  
23  
24  
25  
26  
27  
28  
29  
30  
And I don't know that it's  
possible at all to judge at this time or estimate  
how many northern people will be available to go  
on the full-time operations and maintenance staff of  
the pipeline, let alone how many of those will be  
trained at that time.

Q All right now, looking  
at the program that you have developed already, would  
it be fair to say that that is pointed at the moment  
to construction rather than the later stage of  
operation and maintenance?

A You're speaking of the  
training program that we have under way?

Q Yes, I think you refer-  
red to it as the northern training program.

A It's broader than that,  
Mr. Bayly. It's designed to provide training -- on-  
the-job training, and academic up-grading for people  
who are directing themselves into pipeline operations  
and maintenance, drilling, seismic work, processing  
plant operations, administrative work. I am sure there  
are others I haven't thought of. It's an industry-  
wide plan.

Q Now you've referred in  
that sentence that I read as well to individuals  
becoming skilled in more than one basic technical  
discipline. Could you explain why a person who would  
be given a job would need more than one area of  
expertise, if I may call it that?

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

A It's a phenomenon that is perhaps unique to this industry. Despite the fact that the probability of a mainline break is very low, typically an operating pipeline company staffs itself to be capable of dealing with a break if it occurs. That means that a lot of people are on staff in sort of a fireman role. They're there for that important day when a break occurs. That means that to be fully, properly staffed you need equipment operators, welders, different types of equipment, side boom operators, and a great variety of disciplines. To make the operating staff more efficient in terms of numbers of people, the attempt is usually made to train people over a period of time in a variety of disciplines and decrease the total numbers of people. You still must maintain that level of staff that is necessary to go out and do a repair, but between repairs, which may be many years, you don't want a lot of people on staff that are not being used effectively and efficiently.

Q Would it be fair to say then that you would have a man trained to do emergency welding, who would also be a truck operator on your general surveillance team, if I may call it that?

A That's a possibility, yes.

Q Have you any figures on the amount of time that you would envisage for individuals to become skilled in this way before they would be of any use to you in your operation and maintenance

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 programs? Would it take a year or two years, or  
2 would they train on the job?

3 A It differs, of course,  
4 Mr. Bayly, for each discipline, and it differs accord-  
5 ing to the background skills that a trainee brings  
6 with him when he starts the program, and probably  
7 ranges from -- and it differs according to the level  
8 in the operating structure <sup>at</sup> which you hope to train the  
9 person, those things produce a range that's probably  
10 all the way from a matter of months to many years.

11 Q Would you envisage being  
12 able to do any of this training in the north, or would  
13 it be as the program, as I understand it, has been  
14 going on to remove people from their own areas that  
15 they live in and take them to Calgary or Edmonton to  
16 do this kind of training?

17 A It would be done in the  
18 north to the greatest extent that is possible or that  
19 is effective in the training program. Up till now  
20 considerable of the training has been done in the  
21 south because that's where on-the-job training  
22 opportunities are. But there's another large amount  
23 of training that's done in the north where, for example,  
24 seismic operations, opportunities are on drilling operations, in the north.

25 Q Now, I wonder if I could  
26 address a question to Mr. Carlson, who I understand  
27 has come from Trans-Canada Pipeline? Now, Trans-Canada  
28 Pipeline has a line that goes through Northwestern  
29 Ontario through areas like Hurst and Longlag, Geraldton,  
30 Pierrdmore, where there is a large native population.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

Do you, Mr. Carlson, know whether the people who are involved in operations and maintenance in that area are -- were there any of them or a proportion of them native peoples who had been trained by Trans-Canada Pipeline in operation and maintenance?

WITNESS CARLSON: Yes sir,

I can't give you a precise number of northerners from Northern Ontario who have been hired and have been trained by Trans-Canada Pipelines, but yes, we have had a number of them and the number still are on staff.

Q      Would you be able to  
say whether they represent a significant proportion  
of the people operating the pipeline, or are they  
more noted by their exceptions than --

A I think in this case they would be noted by their exceptions. It's difficult at this point for me to give a precise percentage or number, but this information could be obtained if you want it later.

MR. BAYLY: I wonder, Mr. Commissioner, that may be of some interest as it is a parallel sort of situation, if the applicant would be willing to undertake to provide that kind of information to the Inquiry.

A Well have to check to see if it's available, sir.

THE COMMISSIONER: Trans-

A That's right.

Q So I'm sure it's available.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

I think we should know that. Trans-Canada is the principal gas pipeline operating company in Canada at the moment, I think, and I think we should find that out. Are you two gentlemen, Mr. Carlson and Mr. Bayly, are you talking about -- are you using the same terms in the same way? You said "native" down in Ontario or something, and you said "northerner". Now, did you mean people who live in Northern Ontario who are natives of Northern Ontario, or did you mean native Indian people?

MR. BAYLY: I'm speaking more specifically <sup>of</sup> Indian and Metis people of that area because there may be special training problems in which COPE and its constituents may be particularly interested.

THE COMMISSIONER: Did you mean the same?

WITNESS CARLSON: Yes. I believe the number of native Northern Ontario people on our pipeline would be rather small in number, but I do believe we have had some, and they're still on staff. I'll attempt to get you some more precise information.

MR. BAYLY:  
Q Thank you, sir. Now, on the programs, Mr. Hurd, that you would envisage being used, and the ones which are being used now to train people, do you know of your own knowledge whether these are recognized by the unions involved in pipelining, whether the programs give the graduates the status they need to apply for what are traditionally

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 known as union jobs on operations and maintenance?

2 MR. MARSHALL. Mr. Bayly, perhaps I  
3 should just comment, if I may. We had proposed to  
4 lead fairly detailed evidence about the training  
5 program, probably as part of Phase 4, and there are  
6 others who have been involved in it on a full-time  
7 basis, which Mr. Hurd has not been, and I thought  
8 perhaps you ought to know that, when you are addressing  
9 these questions to him.

10 MR. BAYLY: I think we  
11 understand that.

12 THE COMMISSIONER: I think,  
13 Mr. Bayly, that you might pursue this as far as you  
14 can now.

15 MR. BAYLY: If Mr. Hurd is  
16 aware of this, as he seems to be aware of some parts  
17 of the area that I'm questioning on, perhaps he  
18 could answer, at least to the best of his ability.  
19 I will be content with that and wait for any more  
20 full answer from other panels.

21 WITNESS HURD: With the  
22 qualification Mr. Marshall mentioned, that my involve-  
23 ment has not been full-time, I think perhaps, Mr.  
24 Bayly, all I can say that's useful is that we have  
25 been able to place trainees successfully with companies  
26 in pipeline construction situations. I'm not aware of  
27 any case where the unions involved have caused us  
28 any difficulty in placing these people at all.

29 Q Do you know then whether  
30 these people have been able to join the unions, or

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 whether they have been granted some sort of exemption  
2 or dispensation?

3 A I don't know that.

4 THE COMMISSIONER: You're talk-  
5 ing about operation, working on the operation of the  
6 pipeline after it's built; you're not talking about  
7 construction.

8 A I was referring at that  
9 time to construction, sir, yes sir.

10 Q Oh, you were referring  
11 to construction?

12 A Yes, I believe that a  
13 few of the trainees have been placed on construction  
14 crews.

15 Q Well, in pipeline  
16 construction in Southern Canada?

17 A Yes.

18 Q Well, when Mr. Carlson  
19 was talking about Northern Ontario, Mr. Carlson, you  
20 were talking about the actual operation of the pipeline,  
21 weren't you?

22 WITNESS CARLSON:

23 A Yes, that's right, Mr.  
24 Commissioner. We did have one of the northern trainees  
25 from the program Mr. Hurd referred to working on  
26 construction, I believe, I think he was involved in  
27 welding inspection work.

28 THE COMMISSIONER: Well, I  
29 think we might do this, Mr. Bayly. We might adjourn  
30 now and maybe Mr. Hurd and Mr. Carlson could put  
their heads together and -- over night -- and tell us

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

in the morning  
if there is anything we ought to know about the  
northern training program that they can tell us that  
might eliminate some of the confusion here. It's not  
confusion created by them, it's simply that we're a  
little -- we're not as incisive at this hour as we  
usually are earlier in the day.

MR. BAYLY: I'd like, Mr. Commissioner, to end at the end of the day when people get the giggles.

THE COMMISSIONER: Well,  
you'll have first crack at 9 A.M.

MR. BAYLY: Thank you, sir.

THE COMMISSIONER: What is the union that represents the people who operate the pipeline in Ontario, or the Trans-Canada Pipeline? What is the union that represents the people who work on the pipeline?

WITNESS CARLSON: Trans-

Q You mean the people --  
you will remember, Mr. Carlson, that I visited one  
of Trans-Canada's compressor stations near Kingston.

A That's right.

Q      Last November; none of those people belonged to any union?

A No sir. I would like to think the reason for that is that Trans-Canada's benefits are such that they don't require one.

WITNESS HURD: Mr. Commissioner,

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

I think we can add a similar comment respecting  
construction. My last involvement with the pipeline  
construction, there were no unions involved there either.

Q Well, where was that?

A It's in Alberta, some  
considerable number of years ago, I'd hate to count  
them.

Q I see. Well, the Alyeska  
Oil Pipeline, I take it the workers on that project  
belong to trade unions.

A Very much so.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 WITNESS FIELDER:  
2 A Sir, I think you'd  
3 find that Alberta Gas Trunkline is not unionized either,  
4 nor do I think -- I can't say for certain, but neither is  
5 Westcoast Transmission; I think perhaps it is an  
6 industry trait that the O. and M. personnel are generally  
7 not trade unionists.

THE COMMISSIONER: Well, I --

MR. SCOTT: It seems to be a

10 | fertile field to be plowed.

THE COMMISSIONER: Well,

12 we will adjourn until 9 o'clock in the morning.

(PROCEEDINGS ADJOURNED TO MAY 21, 1975.)

MACKENZIE VALLEY PIPELINE INQUIRY

IN THE MATTER OF AN APPLICATION BY CANADIAN ARCTIC GAS PIPELINE LIMITED FOR A RIGHT-OF-WAY THAT MIGHT BE GRANTED ACROSS CROWN LANDS WITHIN THE YUKON TERRITORY AND THE NORTHWEST TERRITORIES FOR THE PURPOSE OF THE PROPOSED MACKENZIE VALLEY PIPELINE

and

IN THE MATTER OF THE SOCIAL, ENVIRONMENTAL AND ECONOMIC IMPACT REGIONALLY OF THE CONSTRUCTION, OPERATION AND SUBSEQUENT ABANDONMENT OF THE ABOVE PROPOSED PIPELINE

(Before the Honourable Mr. Justice Berger, Commissioner)

Yellowknife, N.W.T.

May 21, 1975.

1 Yellowknife, N.W.T.

2 May 21, 1975.

3 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

4 MR. MARSHALL: Mr. Commissioner,  
5 you asked at the end of yesterday if Mr. Carlson could  
6 obtain some information pertaining to Trans-Canada  
7 Pipeline's hiring and training of native people in  
8 Northern Ontario, and he has been able to obtain some  
9 information and advise you on it now, sir.

10

11 DONALD ERNEST FIELDER,  
12 LEE GORDON HURD,  
13 MELVIN E. CARLSON, resumed:

14 WITNESS CARLSON: Mr. Commis-  
15 sioner, I checked last night. Trans-Canada does have  
16 on staff today three natives from the Northern Ontario  
17 area. We have one welder, heavy equipment operator,  
18 and a utility man. This would be three natives in an  
operating group of 254, I believe.

19 THE COMMISSIONER: What would  
20 the section of the pipeline be? You said Northern  
21 Ontario.

22 A That would be from a  
23 point west of Kenora to Kapuskasing. This is the  
24 central area of Trans-Canada's Pipeline system.

25 THE COMMISSIONER: Thank you  
26 very much.

27 MR. MARSHALL: Sir you also  
28 asked if Mr. Hurd might wish to add anything in respect  
29 to the northern training program that's being adminis-  
30 tered by Arctic Gas, and he has a few comments as well.

Fielder, Hurd, Carlson

1 sir.

2 WITNESS HURD: Mr. Commissioner,  
3 we were to look into the question of any difficulties  
4 that might have been experienced in placing trainees  
5 in construction situations where unions were involved.  
6 I find that on detailed checking more recently that  
7 while there have been substantial efforts to place  
8 trainees in construction, there has been relatively  
9 little pipeline construction over the past two or  
10 three years, and our efforts have not been as success-  
11 ful as I thought they were yesterday. We have had  
12 one trainee in a construction situation working for a  
13 contractor doing some pipeline construction work for  
14 Trans-Canada Pipelines. In that situation the trainee  
15 was an employee of the owing company and was doing  
16 inspection work on the construction. He is a ticketed  
17 welder, doing inspection of construction work and  
18 in that situation was not required to be a member of  
19 the union. There have been discussions with unions  
20 and pipeline contractors associations -- Association  
21 of Contractors -- directed toward arranging that  
22 trainees may be placed in construction situations and  
23 that that situation might be accommodated by unions.  
24 We have every reason to believe that that can be  
25 successfully worked out, but at this stage we have not  
26 had people as union members -- trainees as union members.

27 I might add in perhaps a  
28 clarification of another remark I made yesterday, having  
29 to do with the extent to which construction companies  
30 are unionized. While it's true that operating

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 companies in Canada tend not to be unionized, the  
2 construction companies in recent years have become  
3 very much unionized, and there are only one or two  
4 exceptions now of major contractors who are not union-  
5 ized.

6

7 CROSS-EXAMINATION BY MR. BAYLY (CONTINUED):

8 Q Now, in the application,  
9 Section 13 B, there is a reference to the men who will  
10 be working in the operation and maintenance phase,  
11 moving from one place to another. Has any consideration  
12 been given by your group or people that you know of  
13 working for Arctic Gas to accommodate the families of  
14 people who would be employed in operation and mainten-  
15 ance, or would those workers be living under bunkhouse  
16 type conditions, or men's quartering conditions?

17 WITNESS HURD: Yes, Mr.

18 Bayly. There are perhaps two categories of people,  
19 the first being those people who would be based perman-  
20 ently at one of the three division headquarters which are  
21 Inuvik, Norman Wells, or Fort Simpson. In those  
22 situations we contemplate that employees would be  
23 housed on a permanent basis at those locations, and  
24 we have considered the various means of providing  
25 housing for them, which would include assistance where  
26 that was necessary to the employee to construct his own  
27 family dwelling. Other co-operative means, perhaps  
28 with government, to provide housing for employees at those  
29 locations.

30 The other category is situations

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 where people would be hired on a temporary basis for  
2 special maintenance jobs and would come from settle-  
3 ments other than the three that I mentioned. In those  
4 cases we  
/ have not given consideration to providing housing  
5 or assisting in providing housing in those locations  
6 other than Fort Simpson, Norman Wells and Inuvik.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 Q Would it be fair then  
2 to say, Mr. Hurd, that an employee who wanted one of  
3 the permanent operation and maintenance positions would  
4 have to either be a resident of one of those three  
5 communities or would have to relocate himself into one  
6 of those three communities?

7 A It is probable, Mr.  
8 Bayly. I can't think of a situation now where an  
9 employee could be permanent with the company and  
10 based in another location. That is not to say that  
11 we couldn't find a situation. As the operations plan  
12 is more accurately defined it may be quite practical,  
13 but as we see it now, the permanent employees will be  
14 based in those three locations.

15 Q If I can turn now to  
16 Mr. Fielder. Sir, you showed us some photographs  
17 of the low ground pressure vehicles, some of which  
18 appeared to come from magazines and were in the  
19 drawing stage. Can you tell me whether all of those  
20 low ground pressure vehicles have actually been  
21 developed and put on the market or whether some of  
22 them are still in that -- on the drawing board stage,  
23 if I may call it that?

24 WITNESS FIELDER:

25 A No, Mr. Bayly, every  
26 vehicle that I showed you on the screen has been  
27 designed, constructed and operated.

28 Q Now, you showed us a  
29 vehicle which doubled as a wharf and as, if you will,  
30 a kind of --

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 A -- ferry.

2 Q -- ferry or scow. Is  
3 that one that has been marketed for the purposes  
4 you intended or is it one that could be adapted in  
5 your opinion to the various purposes that you see one  
6 being required for Arctic Gas?

7 A As I understand it it  
8 has been used in the purpose for which I showed it but  
9 not in the Arctic to my knowledge, Mr. Bayly. It's, I  
10 understand, quite common in swamp areas.

11 Q Has it been tested in  
12 the Arctic, when you say it hasn't been used do you mean  
13 it hasn't been tested or it hasn't been employed  
14 commercially?

15 A To my knowledge it hasn't  
16 been used at all in the Arctic.

17 Q Would that have to be  
18 done before you could determine whether or not it  
19 were suitable?

20 A Yes, sir.

21 Q Now, if I can refer to  
22 page 12 under the heading, "Aircraft" in 13-B. I am  
23 referring to sub-paragraph C which refers to a type  
24 C aircraft. Mr. Hollingworth went into what it would  
25 probably be and it appears that it would be a Hercules  
26 or something similar that would carry the same kind  
27 of payloads and perform that way.

28 A That is correct.

29 Q And that particular air-  
30 craft in 13-B it is suggested that that one would be

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 chartered from a commercial airline , I assume. Can  
2 we then infer that types A and B will be owned by the  
3 company or will they also be chartered?

4                   A Sir, that is a decision  
5 that we just have not faced yet. We plan to have  
6 a study completed, oh, hopefully before the end of the  
7 year or by the end of the year which will indicate  
8 to us the use that we will probably require of aircraft  
9 on a weekly basis or monthly basis to help us decide  
10 whether or not we really should have, for example, one  
11 type aircraft -- type A aircraft per district or one  
12 per division or one chartered or two per district or  
13 just whatever is most logical, but we just have not  
14 got to that point yet.

15                  Q Now, when you say that  
16 you have not got to that point, may I infer from that  
17 that you may not have got to the point of knowing  
18 how frequently you will have to use the various  
19 kinds of aircraft to do your operation and maintenance?

20                  A No, we have made an estimate  
21 for planning purposes as to the frequency of flights  
22 that are expected. We haven't pursued it to the point  
23 of estimating contingency flights and the like yet.

24                  Q Can you infer from that  
25 how many aircraft you would require along the length  
26 of the line in the Northwest Territories in order to  
27 effectively carry out at least your basic patrols. I  
28 realize that you have not done it for the contingency  
29 problems as well.

30                  A Yes, certainly that would

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 be one of the things that would help us make that  
2 decision, Mr. Bayly.

3 Q All right, but I gather  
4 you have not made the decision as to how many aircraft would  
5 be required? I don't mean to be bought, but just to  
6 be used, whether they are bought or leased or chartered.

7 WITNESS HURD:

8 A Mr. Bayly, may I elaborate  
9 a little on Mr. Fielder's comments. As Mr. Fielder  
10 said, we have a reasonable fix on the need for aircraft,  
11 certainly in the cases where they are to be used for  
12 scheduled patrols and that sort of thing. Difficulty  
13 with determining whether they should be owned by  
14 the company or leased has to do very much with to what  
15 extent will lease aircraft be available in the area  
16 some years down the road and of course that we can't  
17 know accurately at this stage.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 Q And you say that -- or

2 Mr. Fielder says that we can expect something on this  
3 by the end of the year. Has an approach been made by  
4 Arctic Gas to the various chartering companies, to  
5 your knowledge, to find out whether they will be in  
6 a position to lease the aircraft required, or is that  
7 part of the study that you contemplate being done?

8 WITNESS FIELDER: Neither  
9 one, to my knowledge, Mr. Bayly. You see our operations are  
10 not intended to start for several years, and it's a  
11 little early, we feel, to be asking charter companies  
12 what kind of equipment they will have available, say  
13 five years down the road.

14 MR. BAYLY: Mr. Commissioner, as  
15 this relates to the impact on the use of aircraft in  
16 the Mackenzie District. I would hope that this report  
17 would be available to be tabled at some point before  
18 the Inquiry is finished because I believe that it is  
19 relevant to the considerations that you sir  
20 have to make, and hopefully this will be ready by the end  
21 /and perhaps Mr. Marshall could give us some idea at  
22 some point fairly soon at what stage that report is,  
23 and perhaps a better estimate of when we might  
24 expect it.

25 MR. MARSHALL: We could check,  
26 Mr. Bayly, to see what stage it's at.

27 MR. BAYLY: Thank you, sir.

28 Q Referring to page 20,  
29 under 5.3 which deals with at compressor stations,  
30 I gather the decision has been made, even though the

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 type of turbine hasn't been determined, that the  
2 compressor stations will be unmanned; is that correct?

3 WITNESS HURD: They'll be designed,  
4 Mr. Bayly, and constructed with that in mind, that  
5 they are capable of operating by remote automatic  
6 control, unmaned. I wonder if I may qualify just a  
7 bit? At the same time we have designed a staff that  
8 provides an adequate number of technicians to place  
9 at least two men at each station for a break-in period  
10 that we don't know how long it will go on.

11 Q Perhaps Mr. Carlson  
12 could go on with this. As I understand, some of the  
13 Trans-Canada pipe compressor stations were originally  
14 designed to be unmanned but were later manned. Is  
15 my supposition correct, sir?

16 WITNESS CARLSON: Yes sir.

17 Q Perhaps you could tell  
18 us, if you know, the reason why the decision was made  
19 to man the previously unmanned compressor stations?

20 A Most of Trans-Canada's  
21 compressor stations are designed for remote control  
22 attended operation. Now in the early 1960's the  
23 concept of remote control unattended operation was at  
24 its infancy. We did have operating problems initially  
25 during that period of time. I should add we also had  
26 a tremendous expansion program under way which added  
27 about 800,000 horsepower to our pipeline system from  
28 the period, 1960 to 1964, and about 2,000 miles of  
29 large diameter pipeline in 1962 to 1974. The demands  
30 on our personnel including the operating people, many

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 of whom were devoted to the construction work, were  
2 such that we did not have the time to debug the  
3 unattended or the remote control features of the  
4 stations that were designed for unattended operation.  
5 I might add, a study was initiated by Trans-Canada  
6 within the last three months to review this concept,  
7 and I'm quite sure there is a good possibility that  
8 many of the northern remote stations on Trans-Canada's  
9 system will in effect revert back to unattended  
10 operation. Now, since the early '60's many other  
11 transmission companies have also gone for the remote  
12 control unattended operation concept, and I understand  
13 that the technology has increased greatly over the  
14 years, and successful reliable operation does exist  
15 for this type of facility.

16 Q Would you say in your  
17 opinion that the debugging has reached the stage where  
18 these are at that level of sophistication that they  
19 can remain unmanned?

20 A Yes sir.

21 Q Now, you've referred to  
22 a report which was being prepared. I'm wondering  
23 whether you know if this is a report that is to be  
24 made public, or one that is to go to Arctic Gas?

25 A This was an in-house  
26 Trans-Canada Report that the operating group is working  
27 on to come up with recommendations for the remote  
28 controlled operation of some of the northern stations.

29 Q Now if I can refer to  
30 page 23 under the section that begins at page 22, 5.4.2

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1        called "Line Patrol", the three methods of line patrol  
2        are outlined, and if I may read the sentence that  
3        begins at the bottom of page 22 to the panel:

4                "Where there is a possibility of disturbing  
5                wildlife by aircraft patrols, the patrol program  
6                may be supplemented by ground patrol carried  
7                out in a small vehicle suitable to the terrain  
8                of the particular right-of-way being patrolled  
9                or on foot by at least two specially trained  
10              individuals."

11          I have two questions arising out of that. One is with  
12          regard to the small vehicle, what sort of small vehicle  
13          would you contemplate using, Mr. Hurd?

14                WITNESS HURD: Probably, Mr.  
15                Bayly, a personnel carrier, an L.G.P. type assuming  
16                that the environmental sensitivities occur in the  
17                summertime, which generally they do, and that the  
18                surface is unfrozen so it would be a tracked vehicle  
19                capable of carrying two or more people.

20                Q        And when you say "a  
21                small one", it isn't one of the ones we saw in the  
22                photographs that were shown to us by Mr. Fielder, it's  
23                something quite a lot smaller, the size of a pickup  
24                truck, or larger than that?

25                A        The size of a pickup  
26                truck or smaller.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

Q Now, the other question arising out of this is how do you specially train people to do this foot patrol?

A The training would include two aspects, I'd think. One, having to do with the particular environmental sensitivity that caused us to go to the foot patrol in the first place. They must be aware of what that sensitivity is. Secondly, what to look for on the right-of-way, not that any of that is very elaborate. They would need to look for areas where there is erosion occurring or there is a potential for erosion to occur. They would look for evidence of gas leaks although that is a very unlikely thing for them to find. While they were on the ground they might do some minor routine maintenance of valve assemblies as they went by them, that sort of thing.

Q Now, on these foot patrols, I assume they would be carrying some sort of tools and given that they would probably be doing so, would they be equipped to stay overnight or would they only be able to do a patrol long enough to go from one spot where they could be picked up by some form of transportation to another?

A I can imagine that both might be the case. If it was possible for them to patrol on foot through the sensitive area they would not need to stay overnight and they could be dropped by a helicopter at the start of their patrol and picked up by one at the other end.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

Q Now, when you say they would be specially trained I am assuming because there are a large number of things that could cause sensitivity either to the ground or to the water or the animals or plants that you would have to do this training prior to the individual jobs. Correct me if I am wrong, but I am assuming that you wouldn't train your two or more foot patrollers in all the possible ecological problems, if he was going through a goose nesting area you would tell him to watch out for eggs. If he was going through an area where the ground was particularly sensitive, you might equip him with special shoes. Would that be fair to say? They might be absurd examples, but you would look for specific sensitive areas and instruct him on the spot for those, would that be fair to say?

A Yes, that is correct.

18 I might add, Mr. Bayly, that probably the most important  
19 tool he would carry would be a small radio that keeps him  
20 in contact with the operating base and he can get  
21 advice as he needs it through the radio.

22 Q Now, allowing that you  
23 do not expect a major failure, is it not true that  
24 a major failure if it did occur might well be accompanied  
25 by a fire that could spread to either the tundra or the  
26 surrounding bush depending at what point in the line  
27 it did occur?

A When major failures occur, they are often accompanied by fire.

Q      Have you worked out

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1      contingency plans for the things that would have  
2      to be done in the event of such a fire?

3                    A      Again, Mr. Bayly, not  
4      in the detail that would be contained in the operations  
5      manual. We have determined that people working on the  
6      right-of-way at times of the year when fire is a  
7      possibility would be equipped with extinguishers and  
8      equipment that they would need to control a fire.

9                    Q      If there were a pipe  
10     break and that kind of fire I am assuming that an  
11     extinguisher might well be fairly ineffective. IN  
12     other words, if there were a fire that resulted from  
13     a break it would be quite a large fire, would I be  
14     correct in assuming that?

15                  A      During the time that the  
16     gas is blowing down from the pipeline, the fire is  
17     quite large, yes. That lasts only for a very short  
18     time until that section of the line is depressured.  
19     The fire remaining after that which is burning the  
20     tundra would be a lot smaller fire and extinguishers  
21     would handle it.

22                  Q      I am assuming that in  
23     the event of a large fire that the operation and  
24     mainenance staff would probably not be adequate to  
25     fight it but that the lands and forests authorities  
26     would have to be notified so that their personnel  
27     could assist you, would that be fair to say?

28                  A      The -- one of the instruc-  
29     tions in the O and M manual would be the requirement that  
30     the proper authorities are contacted in every case

1      when a fire is spotted.

2                    Q     Now, one of the things  
3      that you referred to in the question of fires is  
4      found on page 33 of 13-B. I am referring to the  
5      section that you call, "Forest or Tundra Fires". In  
6      the middle of that paragraph on page 33:

7                    "Requested manpower and equipment  
8                    which is not basic to the continuous  
9                    safe operation of the pipeline will be  
10                  made available to assist with the  
11                  control of such fires."

12       Now, have you worked out procedures for deciding which  
13      equipment will be available and following that,  
14      which equipment that the authorities who put out  
15      fires could rely on from the gas company?

16                   A     I am sorry, Mr. Bayly,  
17      procedures for determining which?

18                   Q     Let me give you an example  
19      of it, because it may make it easier to understand.  
20      Assume there is a fire and the lands and forest people  
21      phone you up and say, "Look chaps, we need two L.G.P.s,  
22      an aircraft and a bulldozer, can you supply it?" I am  
23      envisioning situations where you might say yes and  
24      other situations where you might say no, today's  
25      the day we take the L.G.P. out to check compressor  
26      station CA-06, therefore, you can't have it. IN other  
27      words, a decision has to be made. Is it an on the  
28      spot decision or is it a decision that the fire fighting  
29      authorities could rely on if they were looking for  
30      equipment?

Fielder, Hurd, Carlson  
Cross=Exam by Bayly

1                   A     It's one that would  
2 have to be made on the spot. The basis of that  
3 decision though, would be pretty much what the statement  
4 says, any equipment which is not basic to the safe,  
5 continuous operation of the pipeline would be made  
6 available. A routine check at a compressor station  
7 would not be considered basic to the safe and continuous  
8 operation of the pipeline and that would be rescheduled  
9 so that the equipment could be made available to  
10 fight the fire.

11                  Q     So you would envisage  
12 a situation where Arctic Gas would strip itself down  
13 to the bare necessities for the safety of the pipeline  
14 and be prepared to loan or rent or whatever, any other  
15 equipment in the area that would be useful.

16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

A Yes, We would---

there's a limit, I suppose, to how far the equipment could be moved. I suppose the ridiculous extreme would be a fire that occurred 500 miles east of the Mackenzie River Valley, to move equipment that far would put the safe operation of the pipeline in jeopardy. But anything reasonably close would be -- a fire reasonably close, equipment would be made available to fight that, yes.

Q How would this decision be made, Mr. Hurd? Could the man on the job, the district supervisor, make this decision, or would it be one that you would envisage being referred to say your operation and maintenance headquarters?

A I think the district man would make the decision, that and pretty much all other things that he does, of course, he's in touch with the Division Headquarters and so they would be aware; but either way the decision could be made about the same rate. The communication is instantaneous nearly.

Q Have you envisaged the situation that occurs in other parts of the country when there is a major fire, that the fire-fighting authorities recruit whoever they can find to assist them in fighting the fire, rather than asking permission? They just come and get them.

A Yes.

Q And has this been worked into your calculations for operation and maintenance, and have discussions been held with these authorities?

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

A I'm not aware of discussions having been held with authorities. We don't see it, we have considered it and we don't see it as a large problem. Again, because of the statistical probability of the pipeline company needing that equipment at any point in time, the chances are so small that there would be a conflict that it's not a concern.

Q Would you envisage before you got into the operation and maintenance stage, having these sorts of discussions so that you could maintain security and operation while still assisting whatever the authorities requested?

A Yes indeed.

Q Now, on page 31, when referring to major station repairs, that is Section 62, I'm referring you to the third paragraph in 6.2, it refers in that to critical spare parts being readily available. Have you worked out a definition of what critical spare parts might be?

A I'm not aware of a list that has been developed. It's a fairly straightforward operation for the preparation of that list, it's fairly straightforward for an operating company, pretty standard practice among operating companies and we could name several things that would be included on the list, if that would be helpful.

Q What I'm mainly concerned with, without getting into the actual list of things which you consider critical, is whether this

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 involves a listing that has or hasn't been done  
2 simply because it seems to me there may be things that  
3 break that haven't been thought of as critical at one  
4 point, but become critical because they're broken. Is  
5 that sort of thing a problem?

6 A If it did happen and  
7 the spare parts were not available either at the station  
8 site or at the division or District Headquarters,  
9 or from a supplier very quickly, then we were not  
10 careful enough when we made up the list.

11 Q All right, then I'm  
12 assuming that some of the criteria are not only what  
13 you think is likely to break, but how hard it is to  
14 order the part if it has to come from a far-off part  
15 of the world. I assume you'd try and stock it just  
16 in case it does break.

17 A That's correct, yes.

18 Q If it's available at  
19 the local garage, you don't.

20 A That's right.

21 Q Now, on page 33, 6.3.2,  
22 you've referred to environmental considerations. I  
23 won't read that paragraph to you. You did read it  
24 to us earlier on. I'm thinking of the pre-formed  
25 blankets or mats of straw. I'm assuming an area of  
26 damage of some size. Would you envisage having some  
27 factory pre-form these blankets and sending them out,  
28 or what does that refer to?

29 A I expect, Mr. Bayly,  
30 there are a variety of different types. Any material

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

that will provide the insulation that's been removed by the fire would do, and straw is a good example. That sort of material would be used, the hold-down netting would only be required if it was a light material that might be blown away by the wind. I don't know that I can add much more than that.

WITNESS FIELDER: I can't add a great deal. The intent here is to do very much the same sort of thing as you might do if you're trying to grow a lawn on a slope, that is to put down some burlap sacking or something like that which would tend to hold the surface in place until you have a grass catch, and in this instance the intent would be to put down some straw and then cover it over with something that would hold it in place.

Q I'm a bit worried about this because I'm envisaging a fire that covers an area larger than a lawn, perhaps a fire that covers several square miles, which may not even be classified as a major fire, and these pre-formed blankets covered either with chicken wire or plastic netting is going to cover a very large area, perhaps, even in a small fire in terms of the amount of material that would have to be brought in for this sort of thing. There are two concerns. One is that the material may or may not be available, and I'd like you to comment on, in the first instance on whether you've investigated that.

WITNESS HURD: Mr. Bayly,  
maybe this would help. There will have to be a limit.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 to the amount of surface vegetation repair that could  
2 be undertaken by the company, or any other single  
3 entity in the Arctic. You will forgive me for going--  
4 taking the extreme to its ridiculous end. I think the  
5 company could not undertake to repair all damage done  
6 by all fires in the north for all time, so that the  
7 operating company's concern will be to repair damage  
8 caused by fires started by the company, certainly in  
9 all cases. We think those are specifically not note-  
10 worthy. Where a fire is started by some other cause  
11 and crosses the pipeline right-of-way, the pipeline  
12 company's first concern would be to protect that  
13 narrow strip along the right-of-way which might be  
14 subject to erosion if corrective measures were not  
15 taken.

16 Q If I understand you  
17 then, Mr. Hurd, the pipeline company is prepared  
18 (a) to do all repairs to all fires started because  
19 of its own fault, and  
20 (b) to repair the right-of-way where the fire hasn't  
21 been caused by its fault, that crosses the right-of-  
22 way and perhaps threatens the integrity of the  
23 pipeline.

24 A That would be the general  
25 rule. I suppose there is a statistical chance that  
26 a fire could be started by the company's operations  
27 that would go some distance and there may be a limit  
28 to resources of the company to repair all of the  
29 surface that may have been damaged by that. It seems  
30 such an unlikely thing that it hasn't been a concern  
to us.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly.

Q Allright, we are still,

1 though, faced with the problem of the large area being  
2 wired together and covered with straw and I am assuming  
3 that there is a limit to the amount of that that  
4 you can do. You would have to look for another  
5 method in a large fire that might perchance be caused  
6 by the company, its employees?

7 A It does not seem that

8 the area would be that large, Mr. Bayly, if --  
9 Our first concern would be to prevent erosion along  
10 the surface of the right-of-way over top  
11 of the pipeline where erosion could damage the integrity  
12 of the line. Other areas well beyond the right-of  
13 way, some, perhaps more time can be used to make that  
14 repair. It is difficult to be specific.

15 Q This is why I am worried

16 about this paragraph. It doesn't seem very specific.  
17 Would you envisage just using the technique that you  
18 have described in this paragraph on the right-of-way  
19 itself and perhaps employing other techniques off the  
20 right-of-way if you employed any techniques at all?

21 A It is very likely I would  
22 think, that other techniques would be used off the  
23 right-of-way, yes.

24 Q So this, if we can narrow  
25 it down, this paragraph refers to what you would,  
26 do to make sure that your right-of-way, if it were  
27 damaged by fire, did not erode away?

28 A That is correct, yes, sir.

29 Q And it may or may not  
30 refer to other areas which are damaged by a fire that

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 gets off the right-of-way.

2 A Yes.

3 Q Now, Mr. Fielder, just  
4 one question on the presentation you made on the  
5 Russian pipeline facilities. It is just a question  
6 of clarification. How much of the facilities you  
7 described were actually seen by the Canadian delegation of  
8 which you were a part?

9 WITNESS FIELDER:

10 A Sir, we did not visit  
11 Yakutsk. We did not visit the Messoyakha-Norilsk  
12 system at all. We visited a portion of the Medverzhye-  
13 Punga system. If you recall the map, we flew from  
14 the city of Tuymen to the settlement of Nadym  
15 and Nadym is located between the Medverzhye field  
16 which would be to the east of it, and the Long-  
17 Yuganskaya compressor station which was to the  
18 southwest of it. We flew the first day about 30  
19 kilometers to the right-of-way and 20 or 30 kilometers  
20 down the right-of-way to this compressor station.  
21 At the time there was a covering of snow on the  
22 ground, I would estimate six inches, something like  
23 that and we could see mounds on the ground surface  
24 covered by snow which the Soviets told us were bermed  
25 48" and/or 56" pipelines. We were never able to land on the  
26 right-of-way and confirm that that was the case. We have  
27 no reason to doubt it of course. We landed at the  
28 compressor station I named and we toured that  
29 compressor station very thoroughly. The following  
30 day we flew from Nadym where we had overnighted

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 into the Medverzhye field along the pipeline right-  
2 of-way which, gosh, must be 50 kilometers, something  
3 like that, to the Medverzhye field wherein we toured  
4 two gas treatment plants, one that had been designed and  
5 constructed by the Soviets and the other by the  
6 Italians, I believe, on a turnkey basis, and between  
7 these two gas treatment plants overflowed the pipeline  
8 facilities connecting them. We then flew farther out into  
9 the field, circled a drilling rig and flew back home.  
10 So that is the extent that we saw it.

11 Q So with the exception  
12 then of landing and visiting the compressor station  
13 and going back to the Medverzhye field and touring  
14 the processing--

15 A Gas treatment plant.

16 Q -- or treatment plant,  
17 those were your two experiences on the ground. The  
18 rest of the facilities were only seen from the air?

19 A That is quite correct.

20 Q You were able to  
21 guess or surmise, I am assuming that the pipe, the  
22 48" pipe was covered by a berm, is that correct?

23 A In fact, Mr. Bayly, in  
24 places it was no longer covered by the berm. We could  
25 see places where berm restoration work was going on.  
26 We had been told that bermed pipelines, they often  
27 fail annually and that annually they went back and  
28 rebermed them. So far as I am aware, the pipe stayed  
29 in place, but the covering itself had to be replaced.

30 Q Was this referred to you as

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1      an erosion problem?

2                  A      Yes, sir, as I understand  
3      it is the spring runoff that carried it away.

4                  Q      Were they able to suggest  
5      any techniques that they were trying to make sure that  
6      the berm did not run off every spring in the areas  
7      where there were streams, I am assuming?

8                  A      Yes, sir, they showed us their  
9      design for allowing water to cross the bermed pipeline  
10     and essentially what is done, the pipeline is bermed  
11     over by first of all by building up a gravel pad,  
12     perhaps a foot thick, <sup>the</sup> pipe is laid on it and then  
13     the berm formed over top of the gravel pad or the  
14     sand pad and the pipe. Periodically where they  
15     judge the water should cross the pipeline, they just  
16     didn't install the gravel pad and they didn't install  
17     the berm so that pipeline just bridged that gap.  
18     The problem, I think, and this is a Fielder opinion  
19     and nothing that the Soviets said, but the problem, I  
20     think, is that they are working with well-drained,  
21     dry sands and they are not cohesive. They don't tend  
22     to stay together and as they are operating a warm  
23     pipeline, any moisture that does get into this sand  
24     berm that might make the sand more cohesive is driven  
25     out by the warmth, in other words, the sand is  
26     desiccated even, so they do not have a solid mass to  
27     stay over top of the pipeline as they would under  
28     other circumstances.

29

30

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

THE COMMISSIONER: That's  
u're discussing now.

A Yes sir.

MR. BAYLY: Did you note using low ground pressure that you saw being done, or repair that you saw?

A        No sir, it was late  
ere, and the ambient tempera-  
30 below, so I would assume  
y light snow cover that the  
cty well frozen, and we saw  
ines and that sort of thing  
E thing you'd see working

Q Now, on the subject of  
which you've discussed earlier,  
worth's questions in cross-

THE COMMISSIONER: Excuse me.

Just before you go onto that, you said in the report you presented yesterday something about the size of that Medverzhye gas field.

A Yes sir.

Q       When you were in Russia  
was there any -- did anyone say that they had such  
notions as proven reserves and potential reserves?  
Was any light shed upon the real meaning of the  
figures that you were given regarding the size of  
the gas fields in the Medverzhve area?

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

A Yes sir. There are several gas fields in that general area, and once again as I say, first of all there were five fields named, and the first was called Urengoy, and it has proven reserves of 4 trillion cubic meters. Zapolyarnoye has 1.5 trillion cubic meters. Artichascoga has 1.5 trillion cubic meters. Ingubinskaya has 2 trillion cubic meters, and Medverzhye, 1.5 trillion cubic meters. Now these are proven reserves for individual fields in their area. While we were touring one of the gas treatment plants, we were hosted by a Soviet geologist who was, we understood, one of the people who actually discovered the Medverzhye field, and he talked to us quite a little bit about the general area and said, "The general Medverzhye area," which he did not describe by setting boundaries, "had official proven reserves of 14 trillion cubic meters." That's the published figure, so to speak, but in my report these are in quotations marks. In other words I'm quoting him directly. He said, "Local geologists think that 22 trillion cubic meters is closer to being correct." In pursuing that with him we understood that the Soviets, contrary to what is normal here, don't feel the need to go out and define the limits of a field once they find it. They get the feeling that it's a big enough field that it's worth developing, and they start to develop it, and as they are able to increase the facilities in the field, they just expand the field and they just keep moving out drilling and building out towards it to

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 service it. So this is why he was suggesting that  
2 22 trillion was closer to the right number. Then I  
3 pointed out in my report that Prudhoe Bay has less  
4 than 0.8 trillion, so it gives us a feeling for the  
5 huge amount of gas that they have.

6 The other thing that makes  
7 it possible for them to operate in the manner in which  
8 I've just described is that the gas industry in an  
9 area, like Western Siberia, is controlled by one  
10 group. That is it's the Gas Ministry's responsibility  
11 to carry out everything that's involved in the locat-  
12 ing and delivery of gas. They told us, for example,  
13 that they had a budget for 1975 of 800 million  
14 rubles, and it's something like \$1.30 per ruble, that's  
15 over a billion dollars, and this includes the geology  
16 work, the seismic work, the drilling, the development  
17 of gas-gathering facilities, and treatment facilities,  
18 the pipelines that are required, the compressor  
19 stations that are required, the settlements that are  
20 required to house the people, the herds of dairy cattle  
21 that are required to feed them, and each and everything  
22 that goes along with the development of that field.  
23 It's a huge complex, and hence one can control  
24 every facet of it in that fashion.

25 THE COMMISSIONER: Thank you.

26 MR. BAYLY: Q In your  
27 evidence, as I stated, in your cross-examination by  
28 Mr. Hollingworth you were referring to the A.C.V.s  
29 and the types of slopes that you would contemplate  
30 having difficulty with on their own, which they would

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 require assistance. Now, one of my concerns is that  
2 you contemplate in some areas surcharging the pipe  
3 with a berm, which may be as high as five feet in  
4 height. Has this been taken into consideration in  
5 deciding whether or not self-propelled A.C.V.'s can  
6 be used in the way that you had contemplated earlier?

7                   A You mean would there  
8 be a problem in crossing the right-of-way should  
9 there be a five-foot berm across the right-of-way?

10                  Q Yes.

11                  A Well, just in a general  
12 manner, Mr. Bayly, the inclusion of an air cushion  
13 vehicle in our list of materials or equipment that  
14 we would use to get down the right-of-way wasn't  
15 meant to suggest that in each and every case that  
16 the air cushion vehicle would be used. That is that  
17 each of these different types of equipment has specific  
18 proper applications, and should it be necessary to  
19 cross obstacles that are too high for the normal  
20 air cushion vehicle, then we would just have to  
21 use one of the other means.

22                  Q All right. Now, on the  
23 subject of these vehicles, the ones that I have seen  
24 have been very noisy. Is this a comment that can be  
25 generally applied to air cushioned vehicles, or are  
26 there some very quiet ones?

27                  A I guess "very noisy"  
28 is a relative term, but I would agree with you the  
29 only one that I saw operate was what I would call very  
30 noisy. Yes Sir.

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 Q Yes. Do you know whether  
2 or not the company is making any efforts to make them  
3 less noisy, as I understand possibly if they were  
4 used in sensitive areas with wildlife, they might have  
5 at least a frightening effect?

6 A Sir, while I'm digging  
7 out the paper I'm looking for here, so far as frightening-  
8 ing wildlife is concerned, the one comment I can make  
9 is that when the Voyageur that is constructed by  
10 Bell Aero Space was being tested actually in the  
11 north, the effect of the noise on wildlife was being  
12 noted by the people who were actually testing the  
13 thing and the effect varied quite considerably from  
14 -- and this is just recollection -- from birds perhaps  
15 being flying up out of a slough, perhaps a quarter of  
16 a mile away on some occasions, to other birds being,  
17 just totally ignoring it. As a matter of fact, they  
18 related one instance where one particular bird was  
19 run over three times. He just got tired of flying  
20 away from the thing so he sat there, and the air  
21 cushioned vehicle overflowed him. When it passed by  
22 he got up and shook himself off and went back and sat  
23 again, and three times he sat there and let the  
24 machine run over him with no apparent damage whatsoever,  
25 until he just got tired of it all. So I don't think  
26 that you can generalize in this respect.

27 Q I take it his hearing  
28 wasn't checked?

29 (LAUGHTER)

30 A However, so far as work

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 is being done in the development area of air cushion  
2 vehicles, let me mention to you that while these are  
3 vehicles that are in use today, and there are several  
4 in use in the north today, particularly by Northern  
5 Transportation, the National Research Council of  
6 Canada, in conjunction with the Canadian Aeronautics  
7 & Space Institute, and the Department of Industry,  
8 Trade & Commerce, has sponsored a group they call the  
9 Associate Committee on Air Cushion Technology, and  
10 this is actually a working group intended to take  
11 air cushion technology from the place it is today  
12 to make it even more useful to the people who will  
13 want to use the thing, and they have formed a series  
14 of working committees, working groups, they call them,  
15 who are formed from people in industry and in govern-  
16 ment, to try to develop some of these things, and  
17 just to give you an idea what it is they're talking  
18 about, there's a working group on cushioned air  
19 system parametric assessment rigs. I can't translate  
20 that for you. There is also a working group on the  
21 Toad Raft project. There's a working group on con-  
22 trol and guidance. There's a working group on noise  
23 and propulsion in air cushion vehicles. There's a  
24 working group on air cushion pressures on highways  
25 and roads. I noted in here, for example, that as  
26 they develop different air cushion vehicles, these  
27 are being tested and they point out, for example,  
28 -- well, I'll just read one paragraph:  
29       The  
30       "More sophisticated types can be fitted with  
            propellers or other self-propulsion units and

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 carry 25-ton loads at 50 miles an hour."

2 That must be the Voyageur they're referring to.

3 "Current vehicles under test carry up to 70  
4 tons, a 125-ton unit is in service, and  
5 a 3,000-ton unit is in the design stage."

6 So there's quite a little bit of work being done on  
7 this technology, and lastly,

8 "The air cushion vehicle need not be used  
9 in isolation,"

10 and by that I mean the idea of using an air cushion  
11 on other types of vehicles  
assist/ is also being tested by others. You can take,  
12 for example, a fully loaded highway truck and put an  
13 air cushion assist on the thing and perhaps get the  
14 effect of half-loads during road ban purposes, and  
15 things like this, so there are a multitude of different  
16 ways that different vehicles can be applied and  
17 adapted towards the vehicles that we will want to use  
18 during the O. & M. phase.

19 Q I take it you couldn't  
20 do the latter without melting your snow road. That  
21 is running trucks with air cushion assists on a  
22 snow road.

23 A I don't think that would  
24 melt the snow road. The air that's blown down is  
25 ambient air, so if it's cold enough to support a  
26 snow road, it would just move the air from above the  
27 vehicle to below the vehicle. It may well do the  
28 road some good.

29 Q Now, on operation and  
30 maintenance in general, have you gentlemen considered

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 the special problems of the operation and maintenance  
2 of that portion of the pipeline that would cross  
3 Shallow Bay should the cross-delta route be the one  
4 that is formally applied for by Arctic Gas?

5 WITNESS HURD: Yes, sir, we  
6 have. Probably the one most positive evidence of  
7 that is that we recognize that repairs in that  
8 area would take longer, and for that reason the  
9 design proposes dual crossings of Shallow Bay and  
10 other channel crossings.

11 Q How would you inspect  
12 this crossing, Mr. Hurd? Would you use divers or  
13 equipment that took photographs of the installation  
14 from time to time, or what sort of method would you  
15 envisage using?

16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

1                   A     To the extent expectation  
2 is required, which of course is very much less than in  
3 the case of a line buried under the -- under dry  
4 ground, divers are very commonly used, yes, and I  
5 understand that there is equipment available that will  
6 take photographs under water, but I am not familiar with  
7 that.

8                   Q     Has anything been done to  
9 figure out how a diver can see or a photograph can  
10 be taken in the muddy water that comes out into  
11 Shallow Bay?

12                  A     No, I am not aware of  
13 any work that our group has done on that. I think the  
14 point is that the problems that confront you relating  
15 to a pipeline buried underground don't exist under water.  
16 For example, there is not an erosion problem and a  
17 surface vegetation maintenance problem, so inspection  
18 isn't necessary anywhere near to the extent or if  
19 at all.

20                  Q     Would you contemplate  
21 either ice scouring or the ice freezing right to the  
22 bottom of Shallow Bay and coming loose in the springtime  
23 as being something that would cause operation and  
24 maintenance people some worry and work?

25                  A     No, sir, ice related  
26 scour, the type caused by ice jams in other parts of  
27 the Mackenzie River system is not something that is  
28 likely to happen at that end of the delta. The river  
29 gradient is very, very low, so ice jams don't occur  
30 there in the same way that they do on the river before

1 the delta. The type of ice scour caused by ice  
2 moving in from the Beaufort Sea again seems not to be  
3 a problem because the ice does not move in that far.  
4 I have not heard of discussions about freezing to the  
5 bottom and then the ice lifting up, but that does not  
6 sound as though it would be harmful to the pipeline  
7 in any way if it did freeze to the bottom.

8 Q Now, have you done operation  
9 and maintenance studies in the event that the right-  
10 of-way that is applied for and granted is an offshore  
11 right-of-way and can you tell us if you have if there  
12 are any special problems that you have to deal with  
13 with offshore facilities?

14 A We have not spent a lot  
15 of time considering that one, Mr. Bayly. An offshore  
16 routing and I assume you are talking along the Yukon  
17 coast?

18 Q Yes, it is the one  
19 Mr. Dau was referring to in the last panel as a  
20 possibility using linked barges to lay the pipe  
21 several miles offshore.

22 A Yes. We have not spent  
23 a lot of time on that one. It is not our preferred  
24 route. But if the line was offshore, again, I suppose  
25 the same remarks would apply that -- mostly, would  
26 apply that we made with respect to the Shallow Bay  
27 crossing. Inspection is less required than it is for  
28 a line that is buried under dry ground.

29 Q Have you contemplated ice  
30 being a problem in that sort of an installation, that is,

Fielder, Hurd, Carlson  
Cross-Exam by Bayly

1 ice from the Beaufort Sea?

2 A We are aware that if you  
3 go far enough offshore, beyond the barrier islands,  
4 barrier reefs, islands, that there could be ice  
5 gouging from ice coming in from the Beaufort Sea and  
6 that is one of the reasons that we are not enthusiastic  
7 about the offshore route.

8 Q So you would see that as  
9 being enough of a problem to discourage that as a  
10 preferred route?

11 A that is one of the several  
12 reasons, yes, sir.

13 MR. BAYLY: Thank you,  
14 gentlemen, I have no further questions.

15 MR. MARSHALL: Mr. Commissioner,  
16 you asked the other day that we file as exhibits, two  
17 reports pertaining to the Russian trip of Mr. Fielder  
18 and they have been marked as exhibits 124 and 125. ONE  
19 was his own report and the other was the draft  
20 report prepared by the Government. Mr. Fielder has  
21 given me a copy of the final report as prepared by  
22 the Government and would like to file that then in  
23 accordance with your direction.

24 THE COMMISSIONER: Yes, thank you,  
25 Mr. Marshall. Please do.

26 (GOVERNMENT REPORT MARKED AS EXHIBIT 126)

27 MR. BELL: It appears, sir,  
28 that all of the aspects of operations and maintenance  
29 upon which I would like to cross-examine have been  
30 deferred to the socio-economic phase, although I am

Fielder, Hurd, Carlson  
Cross-Exam by Mr. Scott

1       tempted to ask Mr. Fielder if while he was in the  
2 Soviet Union if he managed to pick up any information  
3 concerning the manner in which Native claims have been  
4 dealt with in that country. But I will resist the  
5 temptation.

6 THE COMMISSIONER: That might  
7 be a sword that cuts more than one way. You might  
8 be wise not to ask a question like that.

9 MR. BELL:: Well, I will  
10 resist asking that question and pass the ball to Mr.  
11 Scott.

12 . . . . . MR. SCOTT: Miss Hutchinson just  
13 told me that coffee is ready. Would you like to --

14 THE COMMISSIONER: Well,  
15 how long do you think you will be?

16 MR. SCOTT: Two or three hours.

17 THE COMMISSIONER: Well,  
18 why don't -- that coffee will stay warm, I think,  
19 why don't we carry on for a little while and then  
20 we can enjoy our coffee even more than we would now.

21 || CROSS-EXAMINATION BY MR. SCOTT:

Q      Mr. Fielder, yesterday  
you answered some questions for the Commissioner about  
what might be learnt from the experience of the  
Russians and I think I understood your evidence to  
be that the decision having been made in Canada to  
go to a chilled, buried pipeline, there really was not  
all that much to learn from the Russian experience  
because of the view that -- or the policy that the  
Canadian company had adopted.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1                   A    Certainly, the  
2 manner in which the Soviet pipelines are being designed  
3 and built, Mr. Scott, are different from ours.

4                   Q    Yes.

5                   A    So far as the effects  
6                  <sup>a</sup> of/chilled gas line is concerned, I mentioned that I  
7                  thought we had done our home work pretty well in  
8                  that respect and that in a nuts or bolts or a mechanical  
9                  sense there was little in my estimation to be learned  
10                 in Russia.

11                  Q    But I take it that if  
12                 the policy of Arctic Gas had been, as it was not, but  
13                 if its policy had been to go to an above ground system,  
14                 there would have been something useful to learn from  
15                 observing the way the Soviets had constructed their  
16                 system.

17                  A    Perhaps, as I said  
18                 yesterday, Mr. Scott, my inclination is to think  
19                 that we would learn a great deal more from the Alyeska  
20                 experience than from the Russian experience. The  
21                 reason being that the Russians have not put any  
22                 large diameter lines above ground. It is inferred that  
23                 should we -- if we decided not to refrigerate our  
24                 line it would have had to have been above ground, that  
25                 is the berm would not have worked, couldn't have been  
26                 on ground, it would have to be above ground. Okay,  
27                 the Soviets have not put any large pipelines on  
28                 piles. Further, they don't test their lines  
29                 hydrostatically and hence the pile loadings don't have  
30                 to take the extra mass of liquids during the testing

1 period, whereas Alyeska are facing both of these  
2 problems and as well across the North Slope of Alaska  
3 facing the same types of terrain conditions that  
4 we would face in Canada.

5 Q I take it, however,  
6 that the Russians have a good deal of experience with  
7 river crossings and ice jams in northbound rivers?

8 A River crossings, certainly,  
9 but I don't believe ice jams, Mr. Scott.

10 Q Yes,

11 A They were asked once whether  
12 or not they experienced any ice jams and then we explained  
13 what we meant by an ice jam on the Mackenzie River and  
14 on their river Ob and they said, no, that that was  
15 not a problem.

16 Q Well, has it not been  
17 their practice, perhaps borne of experience to  
18 avoid crossing locations where ice jams occur?

19 A As I understood it ice jams  
20 do not occur anywhere on their river Ob and hence  
21 that was not a consideration when they selected the  
22 river crossing location.

23 Q I noticed that somewhere in  
24 the report, either your report or the department's report,  
25 reference is made to a line where the river is not  
26 only twinned but where there are six pipes that run  
27 across the river.

28 A Yes, sir, that is quite  
29 correct.

30 Q I take it that that is a  
technique that the Russians have developed for crossing  
at particularly difficult crossings?

Fielder, Hurd, Carlson  
Cross-Exam by Scott

A If you  
will accept an opinion on this, Mr. Scott, firstly I  
don't think I'd say that the Russians developed that  
technique. It's quite common, and I can only give  
you the opinion that they do so for the same reason  
that we would want to do so. In other words, what  
we consider to be cheap insurance.

Q Is there not something  
to be learned from the Russian experience in that  
area, for example you've told us that they don't  
appear to have any problems with ice jams, a problem  
that is going to be difficult in our case; but yet  
they have gone in at least one case to laying six  
lines across one crossing, rather than one. Is there  
not something to observe or learn from examining the  
studies and the rationale for that approach?

A Once again, my opinion  
is that it's the same rationale or the same approach  
that is used in Canada and United States by any  
pipeline company who elects to twin a pipeline crossing.  
sir.

Q Well, why do the  
Russians have six lines at this river crossing rather  
than two?

A I can't answer that.  
Once again, a guess is that it was probably easier  
to install smaller -- six smaller crossings than  
perhaps two or three larger crossings on a river the  
size of the Yenesie, I believe, was the river that  
was being referred to.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Q It might also be safer,  
2 might it not? You then have to have six breaks rather  
3 than one or two.

4 A Before you're out of  
5 business, certainly. Yes sir.

6 Q Do you think there is  
7 not something to be learned from further studies of  
8 that experience?

9 A Sir, I don't know what  
10 that would be.

11 Q All right. Well now, I  
12 take it that while most - almost all of the Russian  
13 line is above ground, as you've told us, there is  
14 some local basis and some local experience with buried  
15 pipelines where the gas is carried below freezing  
16 temperature.

17 A No sir.

18 Q I understood from the  
19 report, I think on part of the Yakutsk line is in  
20 fact buried in the first place.

21 A I believe the report  
22 said that it wasn't on piles and left it to your  
23 imagination as to whether it was buried or not, sir.  
24 Excuse me just a moment and I'll just check that.

25 THE COMMISSIONER: There  
26 was a question mark, I think, about that.

27 A Yes, it says,  
28 "The distance between Taas-Tumus and Pokrovsk  
29 is 356 km. and 193 km. of that length was laid  
30 above ground on supports."

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Now, I don't have any idea whether the balance was  
2 buried or bermed, sir.

3 Q Yes. If it was buried  
4 and the gas was in fact below freezing, that would be  
5 something that would be useful to know, if it were so.

6 A Except that I can tell  
7 you without any doubt that the gas was not below  
8 freezing. I was told by the Russians that they have  
9 not installed any sub-freezing gas pipelines.

10 Q Are you saying with  
11 assurance that there is no gas carried in the Soviet  
12 Union at temperatures below freezing, as far as you  
13 understand?

14 MR. MARSHALL: Surely that  
15 goes much too far. He can only report on what he has seen and what  
16 he has been told and what he's heard, and he's described  
17 the limits on the trips that he's made to the Soviet  
18 Union. They hadn't seen everything that's there. Surely  
19 he can't answer that type of question.

20 MR. SCOTT: He was telling me  
21 what he was told. I'm content with that. He can't  
22 know anything more than that.

23 Q Do you understand that  
24 there is no gas -- is that your information that  
25 there is no gas carried at below freezing temperatures?

26 A Yes sir. Certainly  
27 artificially cooled. I guess there might be a possi-  
28 bility through the expansion of gas in the pipeline  
29 that in some short distance in a section of a station  
30 that some gas might get that cold, but it would not.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1       be by design, it would be by accident.

2                     Q     But you would agree with  
3     me, would you not, Mr. Fielder, that if in fact there  
4     were lengths of buried pipe in which gas was carried  
5     that was below freezing, that would be something useful  
6     to see from the point of view of this application, from  
7     the point of view of Arctic Gas.

8                     A     Oh, I'm not sure that I  
9     agree with the word "see", sir. It would certainly be  
10    useful to study if there was a long section of below  
11    freezing gas pipeline and we could monitor it with  
12    thermal equipment, it would be very, very worthwhile;  
13    but as the Russians seem to want to come to Sans Sault  
14    to learn that themselves, I just doubt very much that  
15    it's the case.

16                    Q     Well, anything longer  
17    than 80 feet would be something you haven't seen so  
18    far.

19                    A     No sir, that's not correct.

20                    Q     I'm sorry.

21                    A     Prudhoe Bay is 2,000 feet  
22    long, and the loops at Sans Sault are in that general  
23    order.

24                    Q     I was referring to frost  
25    heave and problems associated with that.

26                    A     So was I, sir.

27                    Q     All right. Well now, is  
28    there anything to be learned from the amount of geo-  
29    technical and soils work that the Soviets do in order  
30    to get information for geotechnical design and location?

Fielder, Hurd, Carlson  
Cross-Exam by Scott

A Sir, let me quote you two sentences from my report, and then I'll explain why I'm saying it.

"The careful reader will note that information given to us in one place did not always agree with that given to us in another area. I make no attempt to referee."

Now what I meant by that was that when we visited the Design and Research Institutes in European Russia, that's in Moscow, Unesk, and indeed in Tuymen, we -- I specifically asked questions regarding how they go about learning what the soils conditions are like. If you give me a moment I'd like to read you the specific question that was posed to them. It reads like this:

"To what extent is non-destructive sub-surface analytical work carried out?"

That is, do they utilize seismic, electro-magnetic, gravity, resistivity surveys, and these sorts of techniques to locate sub-surface inclusions of free ice boulders, etc? This question was first posed in Moscow, and the response was:

"Non-destructive sub-surface analysis is not utilized. Instead, soil drilling and boring is carried out, but by another organization."

And then it goes on beyond that. The same question was posed to another Ministry in another city, and the response was that they use all of those different techniques and they all work so well they're not sure

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 which is best. In Nadym in the field they said, "If  
2 we want to know what's below ground, we drill holes."  
3 So all I'm trying to point out to you, sir, is that  
4 while the conversations might well be useful, my own  
5 impression is that to repeat the sort of discussion  
6 doesn't gain us a great deal.

7 Q Yes. I take it that the  
8 report reveals that somebody indicated to you that  
9 they drill every 25 meters along the route of the  
10 proposed pipeline.

11 A I don't recall that  
12 number, sir, but I'll sure accept it. It's something  
13 very close.

14 Q Yes, and I take it that  
15 that is substantially more drilling than the Mackenzie  
16 Highway people, for example, have been doing.

17 A I believe that to be true  
18 as well, sir.

19 Q Do you think there's  
20 anything to be learned from their judgment about the  
21 desirability of doing that?

22 A Sir, their rationale for  
23 that drilling, I think is different from ours. That is  
24 what they are trying to do, except once again this is  
25 my opinion, is that what they're wanting to do is  
26 to get the pipeline off of piles and back onto the  
27 ground as much as they possibly can to keep the costs  
28 down. Our reason for drilling would be quite different  
29 from that.

30 Q Mr. Hurd, can I turn now

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 to some questions related to line and station startup?  
2 I gather from the description of the line and station  
3 purge and startup that's contained in Section 13, that  
4 the startup process, both with respect to the line and  
5 with respect to the station would involve considerable  
6 air traffic along the line, and in and out of the  
7 various facilities.

8 WITNESS HURD: There would be  
9 more air traffic during that period, yes.

10 Q Is there any ball park  
11 figure you can give us as to the volume of that traffic  
12 at purge and startup time on any given location?

13 A I can imagine more than  
14 one flight per day for those sections which are being  
15 purged and pressured up.

16 Q Is that a flight in and a  
17 flight out? Is that what you mean by one flight?

18 A Yes, a flight along that  
19 pipeline section.

20 Q I see, and in what sort  
21 of aircraft?

22 A Mostly smaller ones which  
23 would be used to carry personnel, and they would be  
24 helicopters or the light personnel, two or three-passenger  
25 aircraft.

26 Q And I take it, and perhaps  
27 it's obvious, that difficulties in the purging and  
28 startup process are likely to increase rather than  
29 decrease that number of flights.

30 A If there are difficulties

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 there may need to be more flights.

2 Q Well now, what length of  
3 pipe are you going to purge as a unit?

4 A Most probably the section  
5 between stations.

6 Q The entire section  
7 between the stations?

8 A Yes, would be purged and  
9 then the next section between the next to stations  
10 would be purged.

11 Q And where in the section  
12 is the air going to be vented?

13 A At the bottom end, the  
14 end opposite from that which the gas is put in.

15 Q And how long is this  
16 whole process of purging the line for one section, how  
17 long is it likely to take?

18 A Oh, it's a matter of  
19 an hour or two.

20 Q You get set up and then  
21 you purge. That takes about an hour, is that correct?

22 A Purging is only one of  
23 several operations involved.

24 Q How long does the whole  
25 operation take?

26 A Oh, for a single section,  
27 a few days.

28 Q Yes, and is there any  
29 unusual noise associated with this process, particularly  
30 with venting?

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1                   A     There is a noise associated  
2 with blowing off of the air at the bottom end of the  
3 system. It's not especially loud because the purge is  
4 done at low pressure. Its purpose is to displace the  
5 air that's in the pipeline with gas, and most often  
6 there is rubber sphere put in that maintains separation  
7 between the two, and it's pushed through by gas.

8                   Q     What level is the noise  
9 from venting?

10                  A     I don't know how to  
11 answer, Mr. Scott. I don't know the level in decibels.

12                  Q     Well, perhaps Mr. Marshall  
13 can find that out. Would that information be readily  
14 available?

15                  A     It could be calculated.

16                  Q     Are there any plans or  
17 indeed any capacity to muffle those noises associated  
18 with purging?

19                  A     Yes, there are attach-  
20 ments that can be put on blow-down stacks that will  
21 muffle the sound.

22                  Q     Are they going to be  
23 utilized on this project?

24

25

26

27

28

29

30

1                   A    We have considered using  
2 them. Not in the purge operation because since it  
3 takes place at low pressure the noise is at a relatively  
4 low level. If a section of the line which was operating  
5 at its full operating pressure needed to be vented,  
6 that is a much larger noise and in that context we  
7 have considered the use of those devices.

8                   Q    Are there similar levels  
9 of noise associated with the start up and testing of the  
10 compressor station itself?

11                  A    Yes, for much shorter  
12 periods of time, but during the start up operation it  
13 is often necessary to blow the pressure down from the  
14 station piping and it starts at the same pressure and  
15 for a few minutes it is quite loud, but the station  
16 piping is a much smaller volume of gas and it blows off  
17 much more quickly.

18                  Q    Well, now, I take it that  
19 the purging and the start up process is going to  
20 -- is going to begin when sections of the line get  
21 completed, is that correct, or is it all going to  
22 begin at once when the line -- just before the line  
23 goes into operation?

24                  A    I don't know that we  
25 can be too detailed on that, nor do we need to be. We  
26 can be quite flexible. It is likely that construction  
27 would move on past several stations. Perhaps on the  
28 lateral up to Richard's Island it would be completed  
29 right to Richard's Island and at that point then  
30 gas which is available from Richard's Island would be

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 used to purge the line moving south.

2 Q I see, so it is con-  
3 templated, is it, generally, that this will be  
4 something that will follow along behind the  
5 completed construction stages?

6 A Follow shortly or some  
7 time later, yes. There is lots of flexibility in  
8 that.

9 Q Yes, obviously there are  
10 engineering and logistical factors involved in deciding  
11 when this should be done, are you going to obtain  
12 any environmental input as to the propriety of doing  
13 it at particular locations at particular times?

14 A Yes, sir.

15 Q From whom are you going  
16 to obtain that input?

17 A The -- probably the  
18 first people we would turn to are the consultants  
19 who are now consulting to the company.

20 Q Yes.

21 A Who are most familiar  
22 with that area.

23 Q And I take it that there  
24 is no reason, bearing in mind the flexibility that  
25 you earlier described why you should not be able to  
26 submit to their suggestions about timing for local  
27 section purging and compressor station purging.

28 A That would be one of the  
29 considerations that we would take into account. Now,  
30 as you mentioned earlier, there are other considerations

Fielder, Hurd, Carlsons  
Cross-EXam by Scott

1 that must be taken into account also.

2 Q Yes.

3 A Because of the flexibility  
4 in the timing of that operation we see no special  
5 problem in reflecting their recommendations.

6 Q Yes, I take it that --

7 or let me ask you, are you also going to consult  
8 with the people who live in the communities to determine  
9 what is the appropriate time for purging and compressor  
10 station start up, bearing in mind the effect it may  
11 have on their communities?

12 A Yes, Mr. Scott, I think  
13 as a general rule, any pipeline operation that  
14 might be of concern to people in a community, assuming  
15 that they are close enough, would cause us to consult  
16 with the people in that community.

17 Q Yes, it can be all  
18 quite alarming if you are not expecting it, I presume?

19 A The blow down of a  
20 high pressure line is quite noisy and if you are not  
21 aware of what it is it can be alarming, yes.

22 Q Now, are there likely to  
23 be the same sort of unusual noises associated with a  
24 compressor shut down --

25 A Yes.

26 Q -- and start up again in the  
27 course of routine maintenance?

28 A Yes, normally, a compressor  
29 unit shutdown includes closing of the -- what is called  
30 the unit valves, which isolates that unit from the

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 balance of the station piping and the blowing down  
2 of the gas on the compressor side of those unit valves.  
3 Now, that is a much smaller volume than we talked about  
4 earlier as being contained in the station piping. If  
5 the whole station is shut down then all of the station  
6 piping is blown down. Both -- either of those operations  
7 last only for a very few minutes.

8 Q And bearing in mind  
9 that this is routine maintenance I am talking about now,  
10 I take it that you will again be able to get  
11 environmental advice and will have some flexibility  
12 about timing when it will occur at any given location?

13 A That is correct.

14 Q Yes, now, I take it the  
15 same noises and so on are associated with emergency  
16 shut down?

17 A Yes.

18 Q But I take it by definition  
19 it is not possible to time when those events will  
20 occur?

21 A That is correct.

22 Q Yes. So, generally  
23 speaking, would it be fair to say, Mr. Hurd, with  
24 respect to start up and routine management, that  
25 you will have to take care of emergencies when they  
26 occur but that apart from emergencies you can -- you  
27 have sufficient flexibility that in -- if not in all  
28 cases, in many cases you will be able to defer to  
29 local or environmental advice as to timing?

30 A That is correct, yes.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Q Well, let me ask some  
2 questions now about patrol of the line. Before doing  
3 that I would like to point out to my friend, Mr.  
4 Marshall that in the transcript on page 5054 and 5055  
5 he undertook to obtain certain information regarding  
6 the maintenance flights. I was going to say the  
7 overview flights, but that could be misunderstood. I  
8 would just like to be sure that for the purposes of  
9 the record, the information that we requested is  
10 clear. I wonder if he could obtain for us order of  
11 magnitude figures on the number of flights, of the  
12 different kinds of aircraft, that is, large transport  
13 planes, STOL aircraft or helicopters on a typical  
14 construction spread during a typical month in the  
15 main construction season. In the second place, the  
16 same data for the peak month during the proceeding  
17 summer season, and thirdly, the same data for the  
18 peak month during the preceding winter both on the  
19 same construction spread. Do I understand, Mr.  
20 Hurd, that those figures could be devised. I recognize  
21 that they would be ballpark figures to a certain  
22 extent, but that they could be devised?

23 A I can speculate, I guess, on  
24 what the construction people might come up with. My  
25 impression is that they could make ballpark estimates,  
26 yes.

27 Q Well, now, turning to the  
28 frequency of flights during the operation and maintenance  
29 phase I gather from Section 13-B that during normal  
30 operation there will be one to three maintenance flights

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 per week to compressor stations, is that correct?

2 A Yes.

3 Q And that those flights  
4 will normally involve cargo helicopters or STOL aircraft?

5 A Yes.

6 Q In addition to that  
7 there will be line patrol flights once a month generally  
8 and as frequently as once a week in the spring and  
9 at other times that are judged to be critical?

10 A Yes, that is right.

11 Q And those flights  
12 will originate and end up where, at the divisional  
13 headquarters?

14 A At the district headquarters  
15 for the district that is being patrolled.

16 Q Well, now, is it likely  
17 that in routine circumstances there will be regular  
18 flights in addition to the ones that I have described  
19 or have I covered them all?

20 A There could conceivably  
21 be other flights for other reasons, compared to the two  
22 categories you mentioned they would be very infrequent.

23 Q Well, let me ask this,  
24 for example, is the routine maintenance work that is  
25 required to be done from time to time either at the  
26 station or on the line likely to be serviced by the  
27 one to three flights a week, or will that require  
28 additional flights?

29 A No, the routine maintenance  
30 work we expect will be covered by those one to three  
flights per week.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Q Is there going to be --  
2 perhaps it's obvious -- a lesser frequency if the  
3 compressor station isn't being utilized or has not  
4 commenced operations?

5 A There would be a lesser  
6 frequency, yes.

7 Q Now in -- on pages 13 and  
8 14 of Section 13-B, it is stated that the flights will  
9 be authorized or supervised by the applicant's district  
10 supervisory personnel. Now, is this principle going  
11 to apply to all flights that occur on behalf of the  
12 applicant, whether the aircraft are owned by the appli-  
13 cant or rented, or whether the service is contracted for?

14 A All flights within that  
15 district, yes sir.

16 Q And that is so even if  
17 Arctic Gas buys a service from some other independent  
18 contractor?

19 A Yes.

20 Q Now, how is this  
21 authorization or supervision going to be carried out?

22 A You mean in a mechanical  
23 sense, Mr. Scott?

24 Q Well, for example, if I  
25 am a -- if I operate a service out of Yellowknife and  
26 Arctic Gas hires me to do certain work in the way of  
27 transportation, let us say, when does the supervision  
28 begin? Let me put the example this way. If I am hired  
29 by Arctic Gas to make a delivery, presumably I'm told  
30 where I'm to pick up the goods and where I'm to deliver

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1        them. Is there going to be any other control, apart  
2        from that? Am I going to be told when I may fly and at  
3        what height I may fly, and over what areas I may not  
4        fly, and so forth?

5                  A      Yes indeed.

6                  Q      Yes, and does that apply  
7        to the whole flight, or simply the flight as it covers  
8        the pipeline right-of-way?

9                  A      To the whole flight.

10                 Q      And are you going to make  
11       this a contractual arrangement between yourself and  
12       others whose services you buy for aircraft?

13                 A      Yes. Typically the  
14       arrangement worked out with a charter company would  
15       specify things like an aircraft must be available for  
16       scheduled line patrol flights which can be precise,  
17       and for -- if the same company provides the larger  
18       aircraft -- for the maintenance flights, those require-  
19       ments would be set out with the schedule as accurately  
20       as you can at the time that you contract. The require-  
21       ment would be that the charter company have aircraft  
22       available to fly under the direction and according  
23       to the scheduling set out by the pipeline company.

24                 Q      The thing that troubles  
25       me is I quite understand how you can authorize and  
26       supervise planes that you own and planes that you man-  
27       and direct yourselves; but if for example you ask an  
28       independent contractor to make a delivery from Fort  
29       Norman to compressor station XYZ, next week, is it  
30       truly your intention to tell him at what height he

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 must fly, over what areas he may not fly because of  
2 a bird population, what route he must take, what hours  
3 of the day he must fly that particular delivery, and  
4 so on?

5 A Yes, I can imagine that  
6 we'd be that detailed and probably more so, and we might  
7 add that it would be unlikely to ask a charter aircraft  
8 company to deliver a certain thing, or infrequent to  
9 ask a company to deliver a certain thing to a certain  
10 location unless there was an employee of the operating  
11 company going with him. We would make every effort  
12 to minimize the flights for our own interests be-  
13 cause of expenses, so he would carry as a passenger  
14 a member of the operating company.

15 Q Is that going to be  
16 routine that a member of the applicant's company will  
17 accompany these independent contractors for flights?

18 A It would be so frequent  
19 as to allow us to call it routine, I think. There may  
20 be occasions where a spare part would need to be  
21 delivered from Division Headquarters or District  
22 Headquarters to a station, as you described earlier.  
23 That would be a very infrequent situation. Most often  
24 there would be a need to carry people along as well.  
25 Those people would be the pipeline company's employees.

26 Q Well, what I'm concerned  
27 about is apart from entering into a contract with these  
28 independent contractors to provide the service, how are  
29 you going to police that they comply with your environ-  
30 mental requirements as to flight times, heights, places,

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 and so forth?

2 A It would be a condition  
3 of the agreement that we enter into with the charter  
4 company and as I mentioned earlier, the great majority  
5 of flights would carry a passenger who is an employee  
6 of the pipeline company.

7 Q And I take it that the  
8 employee you're going to carry is a person who will  
9 have authority to control this independent aircraft?  
10 Independent contractor.

11 A Yes.

12 Q All right. Well now in  
13 Section 14, this is just a point that I don't under-  
14 stand, you state that:

15 "Float-equipped aircraft will not be used  
16 during any phase of pipeline activity."  
17 Is my understanding correct that you don't intend to  
18 use float equipped aircraft at all?

19 A I'm not aware of that,  
20 Mr. Scott. Your reference was which?

21 Q It's Section 14, BN-7,8.1  
22 7.8.1, at page 39. Got that?

23 THE COMMISSIONER: Got that? I think  
24 we'll adjourn for coffee.

25 (PROCEEDINGS ADJOURNED FOR FEW MINUTES)

1 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

2  
3 better  
4 /wait for counsel for Arctic Gas.

5 Mr. Scott, before you start,

6 I said yesterday that I would give the parties my  
7 ruling on the motion made by the Canadian Arctic  
8 Resources Committee about taking evidence regarding  
9 alternate routes. Canadian Arctic Resources Committee  
10 has urged the Inquiry to take evidence regarding  
11 the whole question of alternate routes for the  
12 proposed gas pipeline right after phase one of the  
13 formal hearing is concluded. The formal hearings  
14 are divided into four phases. Phase one, engineering  
15 and construction of the proposed pipeline. Phase two,  
16 the impact of a pipeline and Mackenzie corridor develop-  
17 ment on the physical environment. Phase three, the  
18 impact of a pipeline and Mackenzie corridor development  
19 on the living environment. Phase four, the impact of  
20 a pipeline and Mackenzie corridor development on the  
21 human environment.

22  
23 The Government of Canada  
24 in establishing the pipeline guidelines proceeded on  
25 the assumption that there would be two pipelines from  
26 the Arctic, an oil pipeline and a gas pipeline. At  
27 one time it was felt that an oil pipeline would likely  
28 come first and then a gas pipeline. Now it appears  
29 that a gas pipeline will likely come first and that  
30 if it is built it will be followed by an oil  
pipeline. The pipeline guidelines contemplated a trans-  
portation corridor that in the short run will likely

1 include a gas pipeline and an oil pipeline and that  
2 might in the long run include a highway, a railroad  
3 and electric power transmission line . The assumption  
4 is that the route that is chosen for the gas pipeline  
5 will be chosen for the oil pipeline too. Thus  
6 the route chosen for the gas pipeline will become  
7 a transportation corridor, so any discussion of  
8 alternate routes is inevitably a discussion of alternate  
9 corridors.

10                   The pipeline guidelines require  
11 ArcticGas to file a comparison of the proposed route  
12 of the gas pipeline with alternate pipeline routes.  
13 Arctic Gas has filed evidence relating to alternate  
14 routes. We have already had some cross-examination  
15 directed to the members of the panel on route  
16 selection on the subject. Arctic Gas wants to build  
17 its pipeline along the prime route.

18                   The prime route runs  
19 directly east from Prudhoe Bay along the North Slope  
20 of Alaska and then along the north coast of the  
21 Yukon and the Northwest Territories swinging south  
22 around the Mackenzie Delta and then east to Travallant  
23 Lake.

24                   The interior route which is  
25 the alternate route to the prime route along the  
26 coast proceeds southeasterly from Prudhoe Bay, across  
27 the coastal plain and then through the Brooks Mountain  
28 range of Alaska. Then it brings the pipeline to the  
29 international boundary by Old Crow Flats and then  
30 through the Richardson Mountains into the Northwest

1 Territories and on to Travaillant Lake.

2 The interior route would avoid the Arctic National  
3 Wildlife Range in Alaska and the narrow coastal  
4 plain of the Yukon, but it runs along the south  
5 edge of the Old Crow Flats.

6 The other alternate routes  
7 appear to be the offshore route, which would mean  
8 an underwater gas pipeline from Prudhoe Bay along  
9 the Arctic Coast to the Alaska-Yukon border. From  
10 there it would proceed on the prime route along the  
11 north coast of the Yukon and the Northwest Territories,  
12 swinging around the Mackenzie Delta and then east  
13 to Travaillant Lake. This route and the other  
14 alternates would avoid the Arctic National Wildlife  
15 Range in Alaska.

16 The Fairbanks route would  
17 bring the pipeline south from Prudhoe Bay through the  
18 Brooks Mountain Range to Fairbanks parallelling the  
19 Trans - Alaska Pipeline, then along the route of the  
20 Alaska Highway to Whitehorse. The supply line bringing  
21 gas from the Mackenzie Delta would travel south along  
22 the proposed route of the Dempster Highway to  
23 Dawson and then to Whitehorse. The Trunkline would  
24 travel southeasterly along the route of the Alaska  
25 Highway through British Columbia and Alberta.

26 The Fort Yukon route would  
27 bring the line south to Oksrukyik swinging  
28 southeast to Fort Yukon in Alaska and then along the  
29 Yukon River to Dawson where the supply line from the  
30 Delta would join it. The trunkline would travel south

1 to Pelly crossing and Watson Lake and then along the  
2 route of the Alaska Highway to B.C. and Alberta.  
3 Both the Fairbanks route and the Fort Yukon route would,  
4 from milepost 282 in Alberta, travel along the  
5 prime route to Caroline, Alberta.

6 The edge of the shield route,  
7 the INquiry has received submissions urging that the  
8 pipeline should travel along the -- from the Mackenzie  
9 Delta along the edge of the Canadian Shield, across  
10 the Barrens, through Manitoba and Ontario.

11 I think it is sound to take  
12 evidence on alternate routes at the end of phase one.  
13 The four phases of the Inquiry are not meant to be  
14 like watertight compartments. We have adopted them to  
15 enable us to proceed in an orderly way. In phase  
16 one which is now coming toward its end we are trying  
17 to find out how Arctic Gas intends to go about building  
18 the proposed gas pipeline. In phases two, three and  
19 four, we will be seeking to determine the impact of  
20 the pipeline and all its ramifications upon the  
21 physical environment, the living environment and the  
22 human environment. Then we can establish the terms  
23 and conditions that ought to be laid down in respect  
24 of any right-of-way that might be granted.

25 I think that we should hear  
26 this evidence about alternate routes in Whitehorse.  
27 The people in Old Crow want to have a chance to  
28 discuss these routes and the Inquiry is holding a  
29 community hearing there beginning July 10th. But  
30 people throughout the Yukon may wish to have a

Fielder, Hurd, Carlson

1 chance to discuss these various alternate routes, so  
2 we will hold a hearing at Whitehorse the week of  
3 August 11th and if necessary, the week of  
4 August 18th as well.

5 Arctic Gas should be prepared  
6 to call witnesses at Whitehorse to discuss the reasons  
7 why a comparison of these routes led to the adoption  
8 of the prime route and the rejection of the others.  
9 The Canadian Arctic Resources Committee says it is  
10 prepared to call evidence relating to the whole  
11 question of alternate routes. We will hear that  
12 evidence at Whitehorse. The counsel for Yukon  
13 Indians and any other participant that wants to  
14 will be entitled to call evidence on alternate  
15 routes at Whitehorse, too.

16 We will also take evidence  
17 at Whitehorse relating to supply routes through the  
18 Yukon. Even if the prime route is finally approved  
19 it may be that equipment and material will have to  
20 be shipped via Skagway to Whitehorse and over the  
21 Dempster Highway to build the Prudhoe Bay supply  
22 line.

23 Arctic Gas in its construction  
24 plan filed on March 21st, 1974, declared that if it  
25 required to follow the interior route, some of the  
26 pipe for the Prudhoe Bay supply line might be  
27 moved through Skagway and Whitehorse.

28

29

30

Fielder, Hurd, Carlson

## The Inquiry

has been told that the Arctic Gas project is the greatest venture ever undertaken by private enterprise in terms of capital expenditure. The quantities of equipment, materials and supplies required will be enormous. 1.9 million tons of material will be transported into Canada north of 60. Pipe is the largest component by tonnage. In 1978, 409,000 tons of pipe would be brought in; in 1979, 476,000 tons of pipe; in 1980, 213,000 tons of pipe, a total of 1.1 million tons of pipe. So the question, "By what route or routes, is it all going to be transported to the site of construction?" is very important.

The assumption by Arctic Gas has so far been that the steel pipe for the pipeline would be manufactured in Canada by Stelco and moved by rail from Welland to Hay River and then barged down the Mackenzie River. But Arctic Gas has nevertheless been in touch with pipe mills in many countries, including Japan. It may be significant that all of the pipe for the Alyeska Pipeline was supplied by Japanese Steel Mills. If the pipe for the Arctic Gas line were, even in part, to be obtained from the same source, one of the possible routes for moving the pipe would be by sea to Skagway, then by rail to Whitehorse and then by truck over the Dempster Highway to Fort McPherson. If the pipe were to originate in Japan, four routes to bring it to the north coast would have to be considered.

One would be to ship the pipe

Fielder, Hurd, Carlson

1 directly from Japan through the Bering Strait around  
2 Point Barrow and along the North Coast to the Mackenzie  
3 Delta.

4 Another would be to ship the  
5 pipe to Vancouver and then barge it north to the Bering  
6 Strait and around Point Barrow.

7 Another would be to ship the  
8 pipe to Vancouver and then move it by rail to Hay  
9 River.

10 The other would, of course, be  
11 to ship the pipe to Skagway to Whitehorse, and over  
12 the Dempster.

13 The question whether the  
14 Dempster is used depends on whether the pipe originates  
15 off-shore and on the tariffs likely to be charged by  
16 carriers over the Dempster. All of this is, of course,  
17 dependent upon the prime route or the interior route  
18 being approved. If the route over which the pipeline  
19 were built was the Fairbanks route, or the Fort Yukon  
20 route, it would follow that vast quantities of equipment  
21 and materials would be moved into the Yukon. The Inquiry  
22 is holding most of its formal hearings in Yellowknife.

23 We are also holding hearings in each community  
24 likely to be affected if the pipeline is built. If  
25 it is built, it will affect the people in the Yukon as  
26 well as the people in the Northwest Territories. So I  
27 will be quite prepared when the Inquiry is in Whitehorse  
28 to hear the views of any person or organization that  
29 wants to discuss any matter relating to the building  
30 of the proposed gas pipeline. The hearing in Whitehorse

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 then is to consider alternate routes, supply routes,  
2 and any other matters related to the proposed pipeline  
3 will commence in Whitehorse Monday, August 11th, at  
4 10 A.M. We will be well into Phase 2 by then, but  
5 that is the earliest convenient time to hear the  
6 evidence at Whitehorse. We will not deal at Whitehorse  
7 with the question of the corridor concept itself,  
8 including the impact of an oil pipeline. We will deal  
9 with those matters later on.

10 So carry on, Mr. Scott.

11 MR. SCOTT: Q Mr. Hurd, perhaps  
12 Mr. Marshall put before you the section 14 at page 39  
13 which I referred to. I refer you to that because it  
14 states, I think, clearly that float-equipped aircraft  
15 will not be used during any phase of pipeline activity.  
16 Is that the position of the applicant, as you understand  
17 it?

18 WITNESS HURD: Mr. Scott, the  
19 statement that you referred to is in one of two para-  
20 graphs under the heading,

21 "Water Fowl on North Slope Lakes."

22 In that context, I think we can talk about the operations  
23 and maintenance concepts, we do not feel qualified to  
24 talk about the construction aspects at this time but  
25 with respect to operations and maintenance --

26 Q Yes, I just intended to  
27 ask you about the use of this kind of aircraft in opera-  
28 tions and maintenance.

29 A Fine, and with respect to  
30 the North Slope lakes, we can confirm that it is not

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 the company's intention to use float planes in that  
2 area. The operations will have to be organized in  
3 such a way that they can carry on through the winter  
4 season, which is of course the major part of the year.  
5 So the company will need to be equipped with aircraft.  
6 that, besides helicopters, which of course do not  
7 require lakes, with fixed wing aircraft which have  
8 wheels or skis for a winter operation, and those  
9 same aircraft would be used during the summertime.  
10 So it's not our intention to use float-equipped air-  
11 craft in that area. We should elaborate a little,  
12 however, with respect to other areas along the  
13 pipeline, for example along the Mackenzie River we can  
14 well imagine situations where float equipped air-  
15 craft would be perfectly practical aircraft to  
16 charter, for example, to move equipment or people from  
17 one location on the river to another during times of  
18 the year when there would be no disturbance to water  
19 fowl or other wildlife.

20 Q So I take it then that  
21 that disclaimer should be read as if it specifically  
22 said that it applied only to northern lakes on the  
23 North Shore.

24 A I think that's correct,  
25 Mr. Scott. There is a lot of aircraft travel up  
26 and down the Mackenzie River now with float-equipped  
27 aircraft.

28 Q I raised the question  
29 because in Section 13 in another connection, the  
30 application speaks of finding location of water

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 bodies suitable for aircraft use and it seems to  
2 suggest a conflict, but I think you clarified it by  
3 your answer. Now, can I turn to line patrols generally?  
4 Am I correct in saying in the first few years after  
5 the pipeline goes into operation you will be patrolling  
6 by aircraft, by vehicle, or on foot, as you said this  
7 morning, not only the line but also the ancillary  
8 facilities that are connected with the line?

9 A The term "line patrol"  
10 applies commonly to the pipeline itself. There are  
11 other facilities that will require visits. They fall  
12 more into the category of scheduled maintenance.

13 Q I take it, though, that  
14 apart from maintenance visits, will you be patrolling  
15 on a routine basis such things as borrow pit areas,  
16 temporary access roads, snow roads where they exist,  
17 shoo-fly roads and things of that sort?

18 A Yes, they would be inspected  
19 on a scheduled basis, if there was any risk that  
20 for example thermal degradation might cause erosion.

21 Q So that I take it that  
22 we may expect that as a matter of operational routine  
23 these other facilities, as well as the line itself,  
24 will be regularly patrolled on some schedule that the  
25 company develops.

26 A Yes. As I said, wherever  
27 there's some risk that some degradation might occur  
28 that would need to be checked, yes.

29 Q And I take it that  
30 again the same three general modes of inspection --

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 aircraft, small vehicle, and on foot patrol -- will be  
2 utilized from place to place.

3 A That's correct.

4 Q Now, in Section 13,  
5 speaking of patrol by aircraft, the application indic-  
6 cates that the ideal flying height is 100 to 100 feet.  
7 Has any consideration been given to the possibility of  
8 -- or the risk inherent in conducting your patrol at  
9 a higher elevation coming down when necessary to  
10 inspect specific problems that you may have detected?

11 A If you mean the risk of  
12 disruption of wildlife, yes sir, it has. The elevation  
13 of 500 feet or perhaps higher, in cases where distur-  
14 bance is a serious risk, I'm sorry, let me start again.  
15 The risk of disturbance for example to birds which are  
16 staging is much higher if we fly at the lower altitude,  
17 and for that reason we've said that in those cases  
18 flights <sup>could</sup> be made at a higher altitude, and at a  
19 lower altitude only when it was necessary in those  
20 rare occasions to come down and inspect something  
21 more carefully.

22 Q Well, yesterday you  
23 indicated that at least with respect to the snow geese  
24 and perhaps with respect to other dramatic environmental  
25 events, such as caribou herds and so on, that you  
26 could alter the elevation. I'm really asking you a  
27 more general question how. Has consideration or could  
28 consideration be given to flying your patrols generally  
29 at a higher level on all occasions, recognizing the  
30 necessity to come down to a lower altitude when you

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 either anticipate or see particular problems?

2 A It would seem unnecessary  
3 Mr. Scott, for the greater part of the year. It's  
4 conventional practice for pipeline companies to patrol  
5 the pipeline right-of-way in fixed wing aircraft at  
6 altitudes lower than at 500 feet. That's through  
7 long years of experience have been found to be the  
8 most effective altitude. During most months of the  
9 year there is no risk of disturbance to wildlife, and  
10 we think it would be desirable to fly at that altitude<sup>at those times</sup>.

11 Q Well, I take it when  
12 you speak of no disturbance to wildlife, you're  
13 speaking of no disturbance to what I call dramatic  
14 environmental events like calving grounds and caribou  
15 herds and snow geese ready to fly south; but I take  
16 it, for example, that aircraft flying three times a  
17 week at 100 feet, let us say, over an area, may have  
18 some effect on the ability of people to hunt and trap  
19 in that particular area. I wonder if it's not  
20 possible without any severe risk to the company's  
21 efficiency, to establish that the patrols will be  
22 flown at a higher level, recognizing that emergencies  
23 or things that you detect will oblige you to not only  
24 come lower but in many cases to land?

25 A The three times a week,  
26 Mr. Scott, I think we were referring there --

27 Q I'm sorry, yes.

28 A -- to maintenance.

29 Q Just once a week, isn't  
30 it?

Fielder, Hurd, Carlson  
Cross-Exam by Scott

A It's more often once a month for aircraft patrol of the right-of-way, and in certain seasons where after a heavy rain, for example, then more frequent flights are necessary, but even there it's less than three times a week.

It seems to us that the most desirable thing would be to fly at the lower altitude for pipeline patrol purposes, during times when disturbance is not likely to either hunting or trapping operations or wildlife --

Q I can't get any movement on that figure at all? I mean this isn't an auction, don't misunderstand me, but it might be that fears would be allayed if it could be said that these patrols will fly, let us say, at 500 or 1,000 feet, or whatever meets the reasonable demands of the company.

A I think, Mr. Scott, if we thought it would be of any real help, then certainly we would adjust the flights to that altitude which removes or minimizes the risk of disruption to wildlife and to trapping operations.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 I think that what we are saying is that the majority  
2 of patrol, line patrol flights are not likely to  
3 disturb anything that is going on on the ground anyway  
4 and it is more useful and effective to fly at a  
5 lower altitude. I think that we are saying also that  
6 in those situations where disturbance is a possibility,  
7 in those occasions then we fly at the higher altitude  
8 and come down only when it is necessary, perhaps in  
9 a helicopter and approaching the line in such a  
10 way that we stay as far away as we can from staging  
11 birds, for example.

12 Q I take it because of  
13 your ability to do the job more or less at 1,000 feet,  
14 the elevation is not from the applicant's point of  
15 view a crucial factor?

16 A I think we talked about  
17 times when disturbance is a possibility of going  
18 to some 500 feet rather than the 1,000.

19 Q Well, your American  
20 colleagues talked of 1,000 feet apopos of the  
21 snow geese.

22 A With respect of snow geese,  
23 yes.

24 Q Well, perhaps we can  
25 leave it simply this way. It seems to me that it  
26 would be helpful if the applicant, if it is disposed  
27 to do so, could review that question to determine  
28 whether this is the -- in fact the minimum level  
29 at which they must fly. Mr. Marshall is going to  
30 say something.

MR. MARSHALL: Well, it seems to me that Mr. Hurd has said that they do not see that there is any advantage, really, to increasing the altitude other than at those times of critical importance. Perhaps, Mr. Scott, if you could be more specific -- are you going to lead some evidence at this point?

MR. SCOTT: Well, let's put it this way. If it were shown to the applicant, Mr. Hurd, that there was an advantage, generally, in requiring patrol planes to fly at 500 or 1000 feet, coming down only when necessary, I take it that in those circumstances, you would be prepared to review the matter to see whether that concern could be met and allayed.

A Yes, indeed.

Q I think, Mr. Marshall,  
all this is prelude to phase three.

Well, now, at what elevation  
are the flights into the compressor stations going  
to fly or do you know? Assuming Ministry of Transport  
approvals for your --

A        Most often, Mr. Scott,  
much higher. There may be occasions when -- occasions  
in which a line patrol can be accomplished at the  
same time that a flight is being made into a compressor  
station and opportunity would be taken of all those --  
advantage would be taken of all those opportunities.  
In that case the flight would be down at a height  
similar to regular line patrol altitudes, but most often

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 if the object is to get from one point to the  
2 station it would be at altitudes much higher than  
3 even the 500 feet.

4 Q Well, now, did I understand  
5 you to say to Mr. Bayly this morning that when you  
6 used ground patrols, that is, on foot patrols,  
7 they will be accompanied by helicopters?

8 A There could be occasions  
9 we could imagine where there is a sensitive area, perhaps  
10 a staging area, a molting area, where -- which is not  
11 too far across, in which foot patrol people could be  
12 dropped off by a helicopter at the edge of that  
13 sensitive area and those people would walk through the  
14 sensitive area and be picked up by the helicopter at  
15 the far side of it. In that sense, the helicopter  
16 would be used.

17 Q Yes. But I take it that  
18 one of the objectives of foot patrols will be in  
19 certain areas, places and times to avoid the environmental  
20 risk or damage that may result from aircraft and that  
21 therefore the company's policy will be/land the foot  
22 patrollers and then to go away somewhere and pick  
23 them up later at another point.

24 A Yes, that is right.

25 Q It is not intended that  
26 the helicopters should fly over the foot patrol men?

27 A That would defeat the purpose  
28 of the whole exercises, right, sir.

29 Q So that we can say that the  
30 foot patrol is to be utilized in lieu of aircraft

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1      inspection or vehicle inspection?

2                    A      In that case where the  
3      reason was an environmental sensitivity, there are  
4      other situations where a foot patrol might be used.

5                    Q      And are you going to take  
6      advice from time to time as to the propriety of  
7      aircraft and vehicular patrols as opposed to foot patrol,  
8      environmental advice?

9                    A      That would be a normal  
10     part of the routine, Mr. Scott, that the man responsible  
11     for dispatching the patrol aircraft would be in  
12     regular and frequent contact with biologists so that  
13     he has the advice of where sensitive areas are and  
14     in what seasons and so on.

15                  Q      Well, I take it that  
16     from what you said yesterday that there are going to  
17     be two sources for this advice, first of all will be  
18     the operations manual which will describe, I take it,  
19     regular and recurring environmental events where  
20     foot patrols or other modifications in operation  
21     may be required.

22                  A      Yes.

23                  Q      I take it a classic  
24     example will be the manual will tell you what you can  
25     or cannot do on the north shore where the snow geese  
26     are staging?

27                  A      Yes.

28                  Q      But you would agree with  
29     me also, wouldn't you, that there would be unusual  
30     or unexpected environmental events that will occur

Fielder, Hurd, Carlson  
Cross-"Exam by Scott

1 almost at a moments notice? A sudden appearance  
2 of caribou in a place where they have never been  
3 before.

4 A That is a possibility,  
5 yes, sir.

6 Q And other events of that  
7 type?

8 A Yes.

9 Q Obviously those events --  
10 or let me put the question more positively, I take it  
11 it will not be possible for those events to be covered  
12 by the ground rules contained in the manual.

13 A Except in a general way.

14 Q Yes.

15 A The operators of the  
16 patrol aircraft would be required to watch for those  
17 unusual situations.

18 Q Yes, but when those  
19 unusual situations occur what is going to be the  
20 source of the environmental advice that the  
21 people working in the district will have?

22 A I think , Mr. Scott,  
23 two sources of information, if I can rephrase it slightly.  
24 Firstly, the people who operate aircraft and who  
25 operate in those regions will receive instruction on  
26 environmental matters before they go and begin their  
27 regular work. It will be a part of the training that  
28 they receive. So they won't be ignorant of the  
29 environmental sensitivities that could occur, including  
30 the unusual ones. But secondly there are environmental

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1      people intended to be on staff with the applicant  
2      who would be gathering information from wherever it  
3      is available. The Government Wildlife people, for  
4      example. Information available to that staff probably  
5      would come as much from our own operations as from  
6      anyone else.

7                    Q      Well, dealing, because  
8      we are         here now, although I intended to deal  
9      with it later, where are these people going to be?  
10     Are they going to be in Calgary?

11                  A      Environmental people  
12     if I remember correctly are at the division  
13     headquarters.

14                  Q      Yes.

15                  Can you tell me, perhaps not  
16     now, but can you ask Mr. Marshall to tell me the  
17     disciplines that will be represented on this on  
18     site environmental staff because you would agree with  
19     me, wouldn't you, that many of the environmental  
20     events that occur are not as straightforward as  
21     the snow goose problem but often involve competing  
22     environmental interests in which the decision  
23     to avoid an environmental event "A" may provoke or  
24     injure environmental event "B" occurring somewhere  
25     else.

26                  A      Yes.

27                  Q      and I take it that in  
28     those cases, leaving security and efficiency aside  
29     for the moment as something you have to acknowledge,  
30     the decisions that will be made will have to be made

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 by expert biologists and other environmentalists.

2 A Yes.

3 Q Is there going to be  
4 a staff at Calgary as well as in the district with  
5 this kind of capacity?

6 WITNESS FIELDER:

7 A As I recall it, Mr.  
8 Scott, our current plan was to have a staff -- a full  
9 staff in Calgary and a more minimal staff in the  
10 district organizations. Perhaps someone with a  
11 broad background in environmental matters who  
12 could draw upon the individual talents of those in the  
13 larger centers because we do have virtually instantaneous  
14 communication available to us.

Fielder, Hurd, Carlson  
Cross Exam by Scott

1 Q Well, perhaps I can  
2 expand my request to Mr. Marshall. I would be grateful  
3 to know what the complement intention is with respect  
4 to these environmentalists both at Calgary and where  
5 they exist in the field.

6 MR. MARSHALL: I think we  
7 can get that for you.

8 MR. SCOTT: Q Dr. Fyles,  
9 just pointed out that in the chart for Northern Division  
10 Headquarters at Inuvik for example, it is shown that  
11 there are two persons who fall under the general  
12 heading "Engineering, Technical, Environmental, Lands  
13 and Right-of-Way".

14 I would presume first of  
15 all that one of those at least is going to be an  
16 engineering expert?

17 A Little doubt of that  
18 sir.

19 Q Yes. What about the  
20 other one? Have we any assurance that he will be an  
21 environmentalist or someone who will concentrate on this  
22 area of concern or interest? Or is it too early to say?

23 WITNESS HURD: A I think  
24 we could say this Mr. Scott, that he would be qualified  
25 to do the job that he is there to do, which to a large  
26 extent is gathering and coordinating and judging information  
27 that will come from a lot of other sources. Those other  
28 sources as I mentioned before would be current information  
29 available from the Wildlife Service, the Territories  
30 Government people, other biologists who are working in

Fielder, Hurd, Carlson  
Cross Exam by Scott

1 the area, and consultants who are consulting to the  
2 pipeline company.

3 Q Well, I'll come to an  
4 example later, but let me illustrate for you if I can  
5 the problem that troubles me about this. Obviously when  
6 there is an Operations and Maintenance requirement  
7 the efficient engineering people want to do their work  
8 as quickly and as well as they can.

9 I'm looking for some  
10 authoritative voice in the Applicant that-- authoritative  
11 environmental voice that will impose reins on the natural  
12 desire of the engineer to be efficient, and say, "now,  
13 hold up here, you can't do this now". Is there going to  
14 be such a person and where is he going to be located?

15 A The person who makes the  
16 judgements on the importance of environmental considerations  
17 is the man you talked about. His authority comes through  
18 the Division manager who must balance off the desires  
19 out  
20 of the engineer, who as you pointed/naturally is in an  
21 hurry to repair wash-outs for example on the line, and  
22 the wishes of the environmental person that is advising  
23 him. He's going to very much concerned about looking  
24 after all of those interests, in addition to a lot of  
25 others, because the operating group means to be in  
business for a good long time in this area.

26 Q Well, what authority  
27 is he going to be given? What I'm really looking for  
28 is a kind of policeman.

29 A In a sense he is that.  
30 He has -- through the Division manager, he has the

Fielder, Hurd, Carlson  
Cross Exam by Scott

1 authority to schedule or re-schedule all of the work  
2 that is done within that Division.

3 Q Well, on Panel 1, Mr.  
4 Dau in describing how the route was selected told us,  
5 and I hope I don't do any injustice to him, that when  
6 they convened the environmentalists, if there was not  
7 agreement among the environmentalists as to what should  
8 be done in any eventuality, the poor engineer at the top  
9 had to make the decision essentially ignorant of the  
10 interests that were at stake. Now is the environmentalist  
11 at Inuvik for example going to be given --

12 MR. MARSHALL: I think that  
13 was unfair to Mr. Dau.

14 MR. SCOTT: I think that is  
15 precisely what he said, and I'll give the quotation to  
16 my friend later.

17 MR. MARSHALL: I think there  
18 is a contradiction there.

19 MR. SCOTT: Q Is that the  
20 situation that is going to exist at Inuvik or is this  
21 man, the environmental man going to say this maintenance  
22 job cannot be done now, and is he going to be able to  
23 make that stick?

24 A He will work very  
25 closely with the Division manager, whose decision it  
26 will be to go or not go on a particular job at a  
27 particular time. I think the Division manager will not  
28 be ignorant of the considerations that he must have  
29 in mind when he makes his decision.

30 Q But, ultimately he of

1 course has to decide?

2 A That's correct.

3 Q How long could routine  
4 line patrol flights be interrupted if there were a need  
5 to do so for environmental reasons? Over any given  
6 section of line?

7 A In the winter, it could  
8 be interrupted for a period of some months.

9 Q Three or four months  
10 are you talking about?

11 A I think that's possible.  
12 Of course the risk of environmental disruption or  
13 disturbance in the winter is much smaller.

14 Q How about in the other  
15 seasons?

16 A It's probably not  
17 possible to be specific on that one Mr. Scott. It  
18 depends on the time of year. If it's spring or summer,  
19 and if there have been heavy rains, then it's rather  
20 important to get out and see if erosion has occurred  
21 along the ditch line somewhere. So there is a pressure  
22 to move quickly and do the pipeline patrols more  
23 frequently during that time.

24 Q Well, do I overstate  
25 it if I suggest that in the spring, summer and autumn  
26 the routine will have to be followed barring a major  
27 environmental event? It will be a special case that  
28 will lead to the deviation from the routine?

29 A The routine is quite  
30 flexible in the sense that it needn't be on a particular

Fielder, Hurd, Carlson  
Cross Exam by Scott

1 day. It becomes less flexible as you stretch that  
2 time out. There would be periods in the spring and summer  
3 when it would be very difficult to leave large periods  
4 of time without patrolling the line, and that is more  
5 true during the early years of operation. As time  
6 goes on and the vegetation cover takes hold again you  
7 can delay them a little longer.

8 Q Mr. Bayly asked you  
9 some questions about fires, and I think he covered all  
10 the ones I had to deal with, with one or two exceptions.

11 Is it generally speaking  
12 correct to summarize the Applicant's position with  
13 respect to on-the-line fires, that is opposed to compressor  
14 station fires, that you are not generally concerned  
15 about them. They happen and while you are not going to  
16 start any, you are not going to be worried about them?

17 A I think not, Mr. Scott.  
18 Our concern with respect to fires along the line is that  
19 if the vegetation layer is damaged and erosion of the  
20 underlying soil is a possibility; we are very concerned  
21 that there not be erosion which could undermine the  
22 pipeline.

23 Q Well is this proposal  
24 for example, that from time to time in erosion  
25 sensitive situations that mats of several  
26 miles in dimension should be placed on the land? Is  
27 that a practical suggestion or is that just a theoretical  
28 proposal? It seems to me an incredible exercise that  
29 these mats with plastic or chicken wire covering should  
30 be placed on areas of that size?

Fielder, Hurd, Carlson  
Cross Exam by Scott

1 A We don't envision  
2 Mr. Scott trying to cover several square miles, no.

3 Q What is the largest  
4 kind of mat that you are ever going to deploy?

5 A Certainly hundreds --

6 Q I heard someone saying  
7 campfires behind me. I presume you have a larger mat  
8 than that?

9 A Easiliy hundreds of  
10 square yards. We would conentrate in areas where  
11 the vegetation has been damaged on a slope for example,  
12 and erosion could occur quite quickly after that. If  
13 the area is quite flat we would hope to restore that  
14 area by seeding.

15 WITNESS FIELDER: If I  
16 could interject, during construction when the  
17 ditch is open Mr. Scott we'll have an excellent idea of  
18 of the ground conditions in all locations along the  
19 pipeline route, and this will give us an indication as  
20 well, or another guideline as to what measures have to  
21 over  
22 be taken should a fire occur/the right-of-way, or near  
23 to the right-of-way.

24 Q That's the ground data  
25 chart that I think the geotechnical panel told us would  
be prepared mile by mile.

26 A As the ditch is opened.

27 Q Yes.

28 A Yes, sir, that's what  
29 I am referring to.

30 Q Well, for example are

Fielder, Hurd, Carlson  
Cross Exam by Scott

1 you considering cutting or bulldozing any firebreaks?

2 Either along the line, or adjacent to storage areas?

3 WITNESS HURD: I can't  
4 imagine where any fire breaks would be dozed. I think  
5 we've learned our lesson by the example around Inuvik  
6 of what can happen in that situation.

7 Q So we may take it as  
8 a matter of policy at the moment at least, that there are  
9 going to be no firebreaks in connection with this  
10 line?

11 A No bulldozed firebreaks  
12 We propose that at station sites which are in areas  
13 that could sustain a fire, that there would be cleared  
14 area surrounding the station pad, which is perhaps  
15 protection for the station moreso than the surrounding  
16 terrain.

17 Q Yes, but none of that  
18 is going to be done on the line itself, or in connection  
19 with any storage areas that may be elsewhere than at  
20 compressor stations?

21 A Not along the line  
22 itself. Storage areas connected with compressor stations--

23 Q I'm sorry, not connected  
24 with compressor stations.

25 A Not connected with --  
26 Possibility that it might be done at wharf sites or  
27 pipe storage locations.

28 THE COMMISSIONER: What  
29 lesson did you learn at Inuvik? We've all seen the--  
30 what happened by reason of the fire there, but what was

Fielder, Hurd, Carlson  
Cross Exam by Scott

1 the lesson that you say that you have learned? I didn't  
2 quite follow that.

3 A Oh, nothing  
4 profound Mr. Commissioner. Only that we have seen the  
5 fire break that was bulldozed there to stop the fire,  
6 and we've seen the erosion that occurred following that  
7 bulldozing, and particularly what can happen when you  
8 bulldoze the surface mat.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 MR. SCOTT:

Q Well, I want to get the sense

2 and I may be mistaken that you underplayed the risks of  
3 a forest fire crossing the right-of-way. What are the  
4 risks that you envisage, if a forest fire crosses the  
5 right-of-way, a substantial forest fire?

6 A Only the one that if the  
7 surface vegetation is damaged in a sensitive permafrost  
8 area that there can be erosion following that. The  
9 pipeline itself is not <sup>endangered</sup> at all by a forest  
10 fire.

11 Q So you see this really  
12 as causing, if anything, an erosion and therefore  
13 perhaps a stability problem in connection with slopes.

14 A Yes.

15 Q You don't see any other  
16 consequences at the moment, either for the line or  
17 for the right-of-way?

18 A Not where it's a buried  
19 pipeline, there are no surface facilities, no sir.

20 Q Well now, could I deal  
21 with some questions that touch on the on-ground mainten-  
22 ance of the right-of-way, and I note that in the  
23 application you speak about on-ground maintenance from  
24 time to time, but in no place, because perhaps it's  
25 obvious, do you spell out precisely what that maintenance  
26 may involve, what kinds of maintenance may be required,  
27 and I would like to list with you a number of kinds  
28 of maintenance that may be required, and I wonder if  
29 you can tell me whether these kinds of maintenance are  
30 anticipated being done in winter or in the summer, or

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 both? First of all, repair of erosion scars on earth  
2 flows. I take it that that's a kind of maintenance,  
3 first of all, that may have to be done from time to  
4 time.

5 A We hope --

6 THE COMMISSIONER: Could I ask,  
7 repair of erosion scars on earth what?

8 MR. SCOTT: On earth flow. I  
9 shouldn't have said "on" -- or.

10 THE COMMISSIONER: Or earth  
11 flow.

12 MR. SCOTT: Where the erosion  
13 develops, or the flow, Dr. Morgenstern described it,  
14 moved out from its historical or then current position.  
15 He -- I think his evidence was that repairs might have  
16 to be done, or maintenance might have to be done to  
17 stabilize that situation.

18 Q Is that one of the  
19 maintenance tasks that you contemplate?

20 A Mr. Scott, I guess maybe  
21 I need some more clarification, too. Dr. Morgenstern  
22 talked of three types of soil movement. He talked of  
23 the skin flow, and the deep seated flow, and what  
24 he called the third as the progressing erosion of a  
25 bank.

26 Q I'm talking about a  
27 skin flow, as he described it.

28 A Skin flow is not an  
29 immediate danger to the pipeline itself. It occurs  
30 right on the surface, and there would be no need to

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 do maintenance in a rush in situations where there  
2 are environmental sensitivities associated with that  
3 work, except to the extent that erosion would have to  
4 be stopped. Now in some of those cases it probably  
5 would be desirable to go in the summertime and do the  
6 maintenance then. Other occasions it is probably  
7 more convenient if equipment has to be moved in, ground  
8 equipment, it is better to do it in the wintertime.  
9 I guess that falls in the category of both.

10 Q Well now, the next  
11 perhaps obvious one is repair of ground surface  
12 depressions resulting from permafrost regression, and  
13 I take it first of all that that's a kind of work that  
14 the maintenance people will have to do on the ground.

15 A If it 's very near the  
16 pipeline, perhaps there might be some work done maybe  
17 to fill the depression to prevent further permafrost  
18 regression. That work could be done as easily in the  
19 wintertime as the summer.

20 Q And what you're talking  
21 about here is repairing those regressions, if they  
22 are found on the right-of-way. You're obviously not  
23 going to repair any anywhere else, is that what  
24 you're saying?

25 A Well, and even then if  
26 they are close to the pipeline, regressions are a  
27 natural phenomena throughout lots of the north and we  
28 don't mean to reverse that natural process.

29 Q Yes, and you're simply  
30 concerned to repair the ones that are adjacent to or

Fielder, Hurd, Carlson  
CrossExam by Scott

1 threaten the pipeline security in some fashion.

2 A Yes.

3 Q And it's your judgment  
4 that that task can be performed in the winter.

5 A Yes.

6 Q How about repair of  
7 erosion control structures? First of all that's  
8 obviously something you're going to have to do, isn't  
9 it?

10 A Yes, if it's perhaps  
11 work on a river bank, training structure on a river  
12 bank, that one would need to be done on fairly short  
13 order. If erosion was occurring on a toe load,  
14 for example, on a slope, then the tow load would need  
15 to be replaced fairly quickly so as to prevent a slide  
16 occurring on the slope. So that one example would  
17 have to be done in the summertime.

18 Q Yes, or when it occurred.  
19 Well, it would occur only in the summer, wouldn't it?

20 A Yes.

21 Q How about rebuilding of  
22 the backfill berm over the pipe, or filling in depres-  
23 sions over the backfill berm?

24 A Probably both, Mr. Scott,  
25 depending on the situation. If it was a gradual erosion  
26 of a berm which was armoured on one side to carry run-  
27 off water down the right-of-way to a berm break where  
28 it could then be dissipated on the down slope side  
29 then that repair might need to be done fairly quickly  
30 in the summertime so that erosion damage wouldn't occur.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 I don't know or can't think offhand any other reason  
2 to repair a berm. A berm isn't necessarily a desirable  
3 thing to have.

4 Q How about replacing of  
5 armouring in ditches and on the sides of the backfill  
6 mound?

7 A That's the one I think  
8 I just covered, and it would need to be done fairly  
9 quickly to prevent erosion damage.

10 Q That could be done, I  
11 presume, associated with the replacement of backfill  
12 or the berm mound.

13 A The original construc-  
14 tion would be done when the backfill was replaced.  
15 The repair that was necessary would probably need to  
16 be done at the time that the damage occurred.

17 Q Yes. How about drainage  
18 of ponds or filling of pond areas along the right-of-  
19 way? First of all, that's a task that you may have  
20 to perform from time to time, as part of maintenance,  
21 isn't it?

22 A It seems an unlikely or  
23 at least infrequent problem to be confronted with.  
24 It sounds similar to the earlier one that you talked  
25 about which was to prevent thermal degradation in the  
26 forming of ponds, a thermokarst effect.

27 Q Well if ponds form when  
28 are they likely to be drained or filled in? What  
29 season of the year?

30 A They are not -- it's not

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 a phenomenon that progresses quickly, so it could be  
2 delayed until the most convenient time, which could  
3 be the wintertime.

4 Q How about control of  
5 icings along the right-of-way?

6 A It's not a harmful thing  
7 to my knowledge to either the pipeline or environmental  
8 considerations. I'm not aware that control or any  
9 corrective measure would be necessary, it's a  
10 common phenomena.

11 Q Well, Dr. Harlan's  
12 book, part of the application lists measures that  
13 will be applied in that connection. No doubt before the  
14 pipeline is built you'll have to read it and see what  
15 he tells you to do, but have you any idea at the moment  
16 as to when those icing control techniques will be done?

17 A I guess we're limited  
18 first of all to the winter or early spring, because  
19 that's the only time when the ice will exist. Offhand,  
20 Mr. Scott, I don't know what control measures there  
21 are. Maybe I'll need to check what control measures  
22 are needed.

23 Q Well, these geotechnicians,  
24 you know, left you a lot of things that they say that  
25 you're going to do on a regular basis from now over the  
26 next 25 years, and I'm just concerned to know what season  
27 of the year you think these things can be done.

28 A We can nail that one  
29 down to the winter and early spring.

30 Q How about the building or  
repairing of silt traps?

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1                   A     If such traps were  
2     necessary, then again we're constrained by the seasons  
3     themselves and silting occurs only in the spring and  
4     summer.

5                   Q     And those will be the  
6     seasons? I have to tell you that Dr. Harlan again has  
7     said that you're going to be doing a bit of that.  
8     What about -- perhaps this is obvious -- the re-seeding  
9     of vegetated areas, will that be done in the spring and  
10    the early autumn?

11                  A     Yes.

12                  Q     And also we've been told  
13    that in unsuitable areas there will be planting of  
14    vegetation as opposed to re-seeding. I take it that  
15    that's a spring phenomena.

16                  A     Yes.

17                  Q     How about buoyancy  
18    control measures, when will that be done?

19                  A     We think it's extremely  
20    unlikely that any will be necessary; but if they  
21    were, it would depend on the seriousness of the problem.  
22    Probably in the wintertime when equipment could be  
23    moved into -- assuming that the control measure is  
24    to trench under the pipe or excavate under the pipe  
25    and lower it again and add more weights to it, that  
26    operation would be done in the winter.

27                  Q     Now the geotechnicians  
28    have also told us that as a frost bulb begins to  
29    develop and builds up, there will be another series  
30    of maintenance tasks that they've assigned to you,

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 relating to the control of icings, the construction of  
2 surcharge berms to reduce heave, the construction of  
3 new drainage structures designed to meet the heave as  
4 it arises, the filling in<sup>of</sup> ponds, and the re-grading of  
5 berm breaks where heave occurs. What season of the  
6 year is this maintenance work going to be done?

7 A Much of that list, as I  
8 remember, some of them would be winter operations and  
9 others would be summer. The construction of the berm  
10 itself or of the surcharge --

11 Q Yes.

12 A -- requires moving of  
13 substantial amounts of aggregate material, and that  
14 could just be done in the winter when the surface is  
15 hard. The repair of drainage systems probably, depend-  
16 ing on the repair work that's necessary, could be done  
17 either in the summer or the winter. I'm sure there  
18 are others I've missed.

19 Q How about the control  
20 of icings and new springs that develop?

21 A Control of icings have  
22 to be at the time that they occur, or while they're  
23 still there, so that's winter or early spring.

24 Q Well now, would you  
25 agree with me that all these tasks as they have to be  
26 performed may involve a trade-off as to timing between  
27 the necessity of doing the work reasonably quickly and  
28 the presence or anticipated occurrence of an environ-  
29 mental event of some type?

30 A In a general sense, Mr.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1           Scott, I'm sure that's true.

2           Q     And do I understand  
3 therefore that both the maintenance manual and the  
4 staff you have at Calgary and at the District Head-  
5 quarters will be -- the environmental staff that you  
6 have -- will be consulted to determine the timing of  
7 these various tasks?

8           A     Yes.

9           Q     And that system will  
10 operate in the same fashion as the aircraft system  
11 that we discussed earlier --

12          A     Yes.

13          Q     -- with the same personnel?

14          A     Yes, there would be a  
15 continuing dialogue with all of those people involved.

16          Q     Do you contemplate at  
17 least in the first year or two of operation, a fairly  
18 substantial number of maintenance tasks that will slide  
19 off in other years as you develop experience?

20          A     There would be need for  
21 more frequent repair operations on the pipeline in  
22 its early years, and a much less frequent need for  
23 repairs in the later years.

24          Q     Have you given any  
25 consideration to the development in the first year or  
26 two of a maintenance snow road along the route or  
27 parts of the route?

28          A     No, we haven't.

29          Q     Well now, if it was found  
30 necessary to do what the geotechnicians tell me has to

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1       be done, that is to build along a substantial section  
2       of the pipe a berm or overburden to reduce the heave,  
3       and if that had to be done in the winter can you tell  
4       us how you're going to do it? Are you going to build  
5       a road for that kind of exercise to get the gravel and  
6       surcharge into the location?

7                   A     I can imagine that there  
8       may be a sort of winter road similar to the one that's  
9       been in operation from Norman Wells north <sup>to</sup> Inuvik for  
10      some years or some winters, which would be used by  
11      low ground pressure vehicles which would transport  
12      material from a borrow site or a stockpile site to  
13      the location on the pipeline.

14                  Q     What concerns me is,  
15      as I understand the evidence of the previous panel,  
16      that the risk of heave, if it occurs, is going to be  
17      very pronounced in the -- let's say the first five  
18      to seven years, in that period there, and in the  
19      discontinuous zone. Is there any virtue in a mainten-  
20      ance road, snow road for that period of time in the  
21      event that you have to bring large volumes of gravel  
22      and other overburden in?

23                  A     There may be, Mr. Scott.

24                  Q     Has any consideration  
25      been given to that as a contingency?

26                  A     No, we've not spent a  
27      lot of time on it. The area where frost heave is a risk  
28      tends to be down towards the southern part of the  
29      -- that portion of the pipeline north of 60, in that  
30      area. It's close to the river in some areas. We

Fielder, Hurd, Carlson  
Cross-Exam by Scott

when  
are assuming or were assuming/this was written that  
the Mackenzie Highway would be constructed. There  
will be roads from wharf/sites on the river into the  
right-of-way so there are many options on how you move  
material into the pipeline right-of-way.

Q Well now the geotechnicians told us that there would be very little buoyancy because they were going to protect you against all that; but they said if there was, that Mr. Hurd would fix it up. I just want to understand if that problem arises before startup, are you going to re-set the pipe or are you simply going to cover it and create a berm and build drainage structures?

A The usual practice would be to, as you put it, to reset the pipe, put it back underground where it was intended to be.

Q And I take it that that is the approach that is going to be used if there are any buoyancy problems before the startup? We may anticipate the pipe may be re-set, rather than simply covered.

A It's hard to say that there could never be an occasion where, or a situation where it might be more desirable to leave the pipe where it is. For example, if the buoyancy problem was only a slight upward movement that concerned us, but the pipe didn't float that may be a case where you would simply move in and add more weights and hold it at that level, without trying to excavate under the pipe, which is a very difficult operation.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Q And is environmental  
2 advice in the same fashion, particularly with respect  
3 to the movement of surface and ground water and so on  
4 going to be taken when that kind of problem is con-  
5 fronted?

6 A Yes sir.

7 Q And is it going to be  
8 taken through the same channels as we previously dis-  
9 cussed?

10 A Yes.

11 Q Well now, let me turn  
12 to the general question of monitoring. The geotechnical  
13 panel also told us that as the pipeline is built, a  
14 number of monitoring devices will be built along its  
15 route in order to give the applicant knowledge of ground  
16 and other events, as they occurred along the route, and  
17 I take it that you're familiar with those.

18 A I believe so.

19 Q Yes, and Mr. Fielder al-  
20 ready has referred to this, they also told us that a  
21 history of the trench, if I can call it that, a data  
22 bank of the trench on a mile by mile basis would be  
23 developed. You're familiar with that?

24 A Yes.

25 Q Where is this data bank  
26 going to be maintained?

27 A Probably at each District  
28 Headquarters.

1 Q And is there going to be  
2 someone there who is going to be familiar with how  
3 to use it?

4 A Yes.

5 Q Well, now let's deal  
6 with some of the other monitoring devices. Is there  
7 going to be monitoring of the pipe movement?

8 A If there are areas  
9 where we are concerned that movement may occur, but  
10 it is a very marginal situation and doesn't -- is not  
11 so serious as to cause the designers to add weights  
12 to insure that it won't occur then the best solution  
13 might be to bury it in the conventional way and  
14 install devices that would let the operating people  
15 monitor it so that there may be occasions, yes.

16 Q Well, I take it  
17 that -- I don't want to take you to it, but in the  
18 answer to question 55 on monitoring, the applicant  
19 indicated that the -- 55-2, pipe movement:

20 "Movement of the pipeline in previously  
21 identified critical areas will be  
22 monitored regularly to provide early  
23 detection of any detrimental conditions  
24 of frost heave, buoyancy and settlement  
25 that could lead to stressing of the  
26 pipe. The movement will be measured  
27 using marker rods rigidly attached to  
28 the top of the pipe and contained in  
29 an outfilled sleeve to separate it  
30 from the effects of adjacent soil.

1           Automatic readouts and remote  
2         monitoring will also be considered for  
3         pipeline movement monitoring."

4 Now, do I understand that your department will be  
5 in charge of maintaining and reading this monitoring  
6 system?

7           A      Yes.

8           Q      Will you be in charge of  
9 installing it?

10          A      It would be installed  
11 during the construction of the pipeline.

12          Q      Yes, I see. Have you  
13 any idea, for example, how frequently monitors with  
14 respect to movement will be required to be installed?

15          A      It would be a fairly  
16 infrequent operation, Mr. Scott, because pipe movement,  
17 certainly movement caused by frost heave is a  
18 very slow process. If there was movement caused by  
19 settlement, which is questionable, but again that  
20 would be a slow process, so infrequent reading would  
21 be adequate.

22          Q      I didn't intend to  
23 direct you to the frequency of reading. I wondered if  
24 you could help us as to the frequency of the location  
25 of these devices.

26          A      Oh, I see, the rods  
27 attached --

28          Q      Yes.

29          A      -- to the top.

30          Q      The geotechnical panel

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 placed, as I think, some emphasis on the existence  
2 of this technique for providing you with information  
3 as to what was going to happen. I wonder if you  
4 can tell us how often these devices are going to be  
in place?

5 A If you will permit me  
6 some rough estimates, Mr. Scott --

7 Q Yes.

8 A I would suggest that if  
9 the monitoring is to watch for perhaps floatation  
10 caused by buoyancy of the pipe, then one every 100 feet  
11 or 200 feet or 300 feet probably is adequate because  
12 if that occurs it is very long sections that would  
13 rise up.

14 Q Well, now, --- I  
15 am sorry.

16 A For monitoring of  
17 frost heave then some shorter intervals would be  
18 desirable.

19 Q I take it that you will  
20 also be responsible for maintaining and reading the  
21 ground thermal regime monitors that the geotechnical  
22 panel referred to?

23 A Yes.

24 Q How often are they going  
25 to be placed?

26 A They are required , for  
27 example, on a slope which might become unstable if the  
28 permafrost was allowed to thaw and each slope of course  
29 is different in its dimensions, but locations could  
30 be selected where a change in the theremal regime could

Fielder, Hurd, Carlson.  
Cross-Exam by Scott

1 be detected if that was occurring. I'd guess that not  
2 very many locations would be necessary. They need  
3 to be carefully selected is all.

4 Q Well, I think Dr.

a

5 Morgenstern suggested to us that/mile by mile analysis  
6 would have to be made, but these -- these monitors  
7 in conjunction with slope stability monitors would  
8 exist in anywhere up to a hundred cases.

9 A On a hundred different  
10 slopes.

11 Q Yes, and I take it there  
12 might be more than one monitor on the slopes?

13 A Oh, yes.

14 Q Yes.

15 What I am getting at is this  
16 going to be a heavy task for the maintenance force and  
17 involve periodic but regular visits to the site ?

18 A I wouldn't characterize it  
19 as a heavy task, Mr. Scott. They would need to  
20 check them frequently in the early -- during the  
21 first season frequently. Less frequently as time  
22 goes on -- probably after a few years have passed they  
23 will no longer be concerned.

24 Q Well, let's say in the  
25 first season, how often do you think these monitors  
26 are going to have to be read? A ballpark figure.

27 A We would get advice from  
28 the geotechnical people on that one. My guess would  
29 be every month or so during the summer.

30 Q And I take it that this

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 requires the entry of somebody in there physically or  
2 the landing of a helicopter or what have you.--

3 A Yes.

4 Q -- to -- and I take it  
5 that those flights were not included in your routine  
6 patrols of the line?

7 A That is correct.

8 Q Would any of this --  
9 what is the season over which you would want to  
10 read these meters?

11 A Oh, it would be done  
12 in the summertime, otherwise the information wouldn't  
13 be relevant.

14 Q Well, I am new here,  
15 when does the summertime begin and when does it  
16 end?

17 A At what location, sir?

18 Q Let's take half  
19 way up. How many months of this is going to go  
20 on?

21 WITNESS FIELDER:

22 A If I could interject a  
23 comment here, I suggest that if it is in the Norman  
24 Wells area you would probably pick some time in  
25 early September as one of the times for reading because  
26 that is the date at which the active layer normally  
27 reaches its deepest depth and hence is the time of  
28 most concern. You would probably pick sometime in  
29 mid-July and sometime in early spring. Perhaps three  
30 times a season, during the thawed period would be

1 satisfactory and those dates would be shifted either  
2 forward or back depending upon whether you went  
3 north or south.

4 Q Over two or three  
5 months?

6 A I would say from  
7 June to September, perhaps three readings.

8 Q Yes. Well now, I take  
9 it, Mr. Hurd, it is going to be the  
10 responsibility of you people to collect the information  
11 or the readings, then what are you going to do with  
12 it?

Fielder, Hurd, Carlson  
Cross-Exam by Scott

WITNESS HURD: As long as the readings

indicate that there is no undue permafrost regression , we do nothing to it.

Q Well, who is going to make that judgment? Is it going to be the maintenance people at the District Headquarters, or is that decision going to be made elsewhere?

A        A lot of the judgment could be made by the operating people at the district or Division Headquarters. If it's a more complex problem, then advice would be sought from geotechnical experts.

Q And who is going to decide what remedies or solutions are appropriate in each of the cases?

A        Most often the district manager who again would consult with people in the Division Headquarters and consultants, wherever he needed to go to get the information he needed.

Q      What I'm really concerned about is the flow of information. As I read their evidence, both Dr. Slusarchuk and Dr. Morgenstern, dealing with frost and slopes, placed a great deal of emphasis in their assurance that this could be done on the existence of these measuring devices and the data bank about the trench would keep the constantly in touch with developments as they occurred on the ground so that they could anticipate problems. Now, what I'm concerned about is in the field day by day how is that process going to operate? Who is -- are

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 you going to have a slope stability man on staff?

2 A I doubt we need that, Mr.  
3 Scott, although the engineering group in the Division  
4 Headquarters would have some expertise in that area.  
5 But they would be aware of which slopes the design  
6 people said might be sensitive or subject to slides.  
7 Part of the routine operations would be the gathering  
8 of this information and its analysis, and the following  
9 corrective measures, if that was necessary.

10 Q Well, let me ask the  
11 question more concisely, if I can. The expert panels  
12 that have been presented to the Inquiry have comprised  
13 employees of Northern Engineering Services and outside  
14 part-time consultants. None of them, as I understand it,  
15 perhaps with one exception, is an employee or anticip-  
16 ates being an employee of the applicant, Arctic Gas.  
17 Now what resource are you going to have to assure us  
18 that expertise will be available to analyze this data  
19 and respond to it on a day by day basis when the  
20 pipeline is built and in operation?

21 A The question was what  
22 resource will we have available?

23 Q What personnel are you  
24 going to have in place of Dr. Slusarchuk and Dr.  
25 Morgenstern and Dr. Hardy and all the other experts  
26 that are now available to say how things will be run?

27 A The engineering people  
28 on staff will be knowledgeable in these areas, and to  
29 the extent that they need help, I think we can assume  
30 that consulting assistance will be at least as available

Fielder, Hurd, Carlson  
Cross-Exam by Scott

then as it is now. It's not uncommon for pipeline companies, when an erosion problem develops, or when a pipeline instability problem for any reason develops, to go to consultants such as Dr. Hardy or Dr. Morgenstern and obtain their advice on what should be done in a certain situation. A large part of the work they do is just that.

Q Well, Dr. Clark's panel told us that at least during the construction phase there would be geotechnical monitors on the ground observing and commenting and directing the work who would have the same -- not the eminence perhaps -- but the same geotechnical background and experience that was represented on that particular panel. Are you going to have any such resource in terms of your operations and maintenance program?

A Not in the same way, Mr. Scott. The consulting people will be available to the operating staff. I can't imagine needing a very specialized sort of advice with any frequency at all. It would be the rare occasion where a particular problem has come up and the people on staff will be expert enough in that area to recognize that it is a particular problem, and expert consulting people will be available to them.

MR. SCOTT: Yes. Dr. Fyles has handed me a note commenting that yesterday you told us about multi-discipline employees. Perhaps you could teach Dr. Slusarchuk to drive a truck. It's 12:30, Mr. Commissioner.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

THE COMMISSIONER: Yes, I

think it is 12:30, so we'll adjourn until two o'clock this afternoon.

(PROCEEDINGS ADJOURNED TO 2 P.M.)

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

2 MR. SCOTT:

3 Q Mr. Hurd, I gather from  
4 Section 14 of the application that the applicant  
5 visualizes that after abandonment which I guess is  
6 not one of our immediate problems, but that after  
7 abandonment the pipeline will be simply left in place.

8 WITNESS HURD:

9 A We consider that a  
10 possibility, Mr. Scott. It is not uncommon for pipelines  
11 that are abandoned in these days to leave the pipe  
12 in the ground.

13 Q Yes, in view of the  
14 considerations that you have discussed with us relating  
15 to erosion and slope stability and so on. Has  
16 any consideration been given to some form of patrol  
17 or right-of-way maintenance at that period and thereafter?

18 A We've not considered  
19 it in any detail, Mr. Scott, we imagine that abandonment  
20 occurs probably forty or fifty years in the future.

21 Q Oh, I thought it was  
22 25 to 30 years.

23 A No, the pipeline can  
24 be expected to operate on the basis of reasonable  
25 estimates of potential reserves for much longer  
26 than the 25 to -- 20 to 25 years.

27 Q I see. In any  
28 event I gather, no premature consideration has  
29 been given to those matters?

30 A Not in detail. We imagine

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 that the same procedures could be applied after  
2 abandonment if the pipe is recovered which would make  
3 those procedures necessary that are applied  
4 after construction.

5 Q Now, in response to

6 the Assessment Group's concern, response number 56 and  
7 I don't think you have to trouble to get it out, it  
8 was indicated with respect to abandonment that  
9 one consideration difficult to predict was whether  
10 permafrost would thaw out in the long term and the  
11 answer provides that "an indication of areas along  
12 the right-of-way where this permafrost thaw, may  
13 occur may be obtained by observing the changes in the  
14 permafrost table at the edges of the right-of-  
15 way." And I take it that you are familiar with  
16 that general approach to the problem?

17 A Yes.

18 Q When do you intend to begin  
19 to do this monitoring of the table along the edges  
20 of the right-of-way?

21 A It could start quite  
22 early, Mr. Scott, after construction. That sort  
23 of natural regression of permafrost would be a  
24 very slow process --

25 Q Yes --

26 A -- and probably looking  
27 at it or checking once a year would be more than  
28 adequate.

29 Q Do you intend to  
30 start that kind of monitoring as part of the operation

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 and maintenance phase at the beginning?

2 A In areas where regression  
3 of the permafrost would put the -- might put the pipeline  
4 in jeopardy then that would be checked starting early,  
5 yes, sir.

6 Q How is that kind of monitoring  
7 going to be done?

8 A Probably by very simply  
9 probing through the active layer at that time of  
10 year when it is at its maximum depth.

11 Q Yes, have you made any  
12 preliminary determination as to the portions of the  
13 right-of-way or the extent to which the right-of-way  
14 will be monitored in that fashion?

15 A Not in detail, Mr.  
16 Scott. We would need to know the type of soil  
17 in which the pipeline's been laid to know whether  
18 it's high ice content material or whether it is  
19 harmless if the permafrost does regress.

20 Q Will that be a determination  
21 that you can make after your completed soil survey's  
22 in hand?

23 A That would be done  
24 during construction.

25 Q Yes, have you given  
26 any thought to beginning this monitoring process in  
27 a general way before clearing of the right-of-way so  
28 that you will have a control against which to measure  
29 the subsequent monitoring?

30 A Not in that specific way.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 The comparison can be made by probing just outside  
2 the right-of-way where it was not cleared, so it is  
3 easily compared.

4 Q Well, now, some other  
5 unrelated questions connected with security of the  
6 line and the public. You have conceded, I think that  
7 it is inevitable that the line, the right-of-way  
8 will cut through not only hunting and trapping  
9 areas, but across normal travel routes that people  
10 living in the area will have become accustomed to  
11 use.

12 A I think that is probable,  
13 yes.

14 Q And I take it that it  
15 is evident that the existence of the pipeline and the  
16 compressor stations will at least for awhile be  
17 an object of curiosity and people travelling or  
18 trapping in the neighbourhood will come out and have  
19 a look to see what is going on at your compressor  
20 stations and on your line.

21 A Probably.

22 Q Yes, and I take it that  
23 in those circumstances, neither the compressor  
24 stations nor the stockpile sites and equipment  
25 storage points will be manned or protected apart from  
26 a fence?

27

28

29

30

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1                   A     Plus perhaps  
2     in critical situations an alarm system that would  
3     alert the Gas Control Centre that there's been a break-  
4     in        -- if I could call it that.

5                   Q     Well, if someone gets  
6     over your fence at a compression station, where is the  
7     alarm bell going to ring?

8                   A     In the Gas Control Centre.  
9                   Q     That's not in Calgary,  
10    is it?

11                  A     Well, yes sir, it's  
12    there and the information would be available also at  
13    each District Headquarters.

14                  Q     Is there any other plan  
15    under way or being considered to ensure the security  
16    of the facilities, and I speak not only of storage  
17    depots but of compressor sites, apart from the fence  
18    and an alarm bell?

19                  A     There would be the usual  
20    precaution of locking doors, locking the gates on the  
21    fence, that sort of thing. Beyond that, I'm not aware  
22    of any discussions we've had.

23                  Q     Well, isn't it possible  
24    that these sites will be, if care is not taken, of  
25    some danger to an impertinent and unlawful intruder.

26                  A     It could be.

27                  Q     Well, what steps are  
28    going to be taken to protect against that even\_tuality?

29                  A     Only those, Mr. Scott,  
30    that I talked about up till now. They are the only

Fielder, Hurd, Carlson  
Cross-Exam by Scott

ones that we have discussed up to this stage. Certainly there would be warning signs, and I'm talking about the protection of the people who would go in, there would be warning signs so they would understand that it's a hazardous area.

Q Well, I really raise the question because the sense that the compressor stations will be unmanned causes me some trouble. In fact, is there any plan on foot to devise a scheme and a complement structure whereby they can be manned?

A The personnel complement that the company has for each of the five operating years includes enough technicians so that at least two could be located at each station for as long as it takes until we're satisfied that they are no longer required. So in that sense we are capable of manning them.

Q Well let me ask you then,  
I know you'll be as candid as you have been all along.  
Is it, after the first year of operation is it -- is  
there not a very reasonable prospect that these compres-  
sor stations will have to be manned?

A After the first year?

Q After the first year.

which is obviously a difficult year, but after that isn't there a reasonable prospect that you will have to devise a manning complement for them and in fact man them on a full-time or at least substantial basis?

A In my opinion, Mr. Scott,  
no. It's not uncommon for pipelines to operate under

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 the mode that we've described, the remote automatic  
2 control.

3 Q Well, leaving aside the  
4 security of the line from the point of view of its  
5 owners, are you satisfied that all possible or  
6 desirable precautions have been taken to protect the  
7 public lawfully or unlawfully entering the facilities?

8 A We have considered all  
9 that have occurred to us, Mr. Scott. I can't think of  
10 any other precautions that we might take.

11 Q I take it that the public  
12 and particularly the hunting and trapping public, are  
13 going to be permitted to use the right-of-way and  
14 cleared areas ~~for~~ travelling and for hunting and  
15 trapping purposes.

16 A Yes.

17 Q Now, this morning we  
18 discussed routine maintenance and patrols, and I'd like  
19 to ask you some questions this afternoon about major  
20 repairs and unexpected contingencies but before doing  
21 so I would like to deal with the equipment that you've  
22 described, or that Mr. Fielder has described as being  
23 utilized. In particular, the rologen which was shown  
24 I think, in one of the photographs, and the A.C.V. Now  
25 I take it both you and all members of the panel under-  
26 stand that these pieces of equipment, like others; have  
27 their optimum uses, and they are specified generally  
28 by the manufacturer or supplier, is that correct?

29 A Yes.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Q And for example, dealing  
2 with the A.C.V., I think everybody understands that  
3 stationed at Inuvik it may indeed be a very useful  
4 piece of equipment in carrying large supplies in volumes  
5 along the North Shore and up to Arctic Red and on such  
6 trips as that, and that would be the kind of usage of  
7 that equipment that is clearly contemplated by the  
8 manufacturer's specifications; isn't that so?

9 A Yes, that's correct.

10 Q I must say, and perhaps  
11 Mr. Fielder corrected it this morning, our concern about  
12 this and other pieces of equipment arose when we began  
13 to get the impression that if the A.C.V., for  
14 example, was going to be used to travel along the right-  
15 of-way up 8-degree hills and over six-foot objects,  
16 let me just ask a couple of questions: I take it that  
17 there is going to be no experimenting with the use of  
18 any of these vehicles?

19 A I wonder if I might refer  
20 that question to our vehicle expert?

21 Q I think he was trying  
22 to tell us this morning that there wouldn't be, and  
23 I just want to have it confirmed.

24 WITNESS FIELDER: You thought  
25 I said this morning that there would be no experiment-  
26 ing with A.C.V.s?

27 Q The way it was left  
28 yesterday was that it seemed to me that the prospect of  
29 the utilization of the A.C.V. was to cover a whole  
30 range of uses, some of which would be perhaps a little

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1       unusual for it, and I understood you to say this  
2       morning that in fact that would not be the case.  
3       Am I correct, that it would be used as its specifica-  
4       tions -- as its manufacturer's specifications detailed?

5                  A      Should we purchase an  
6       air cushion vehicle that has been designed and in  
7       operation with a certain set of specifications, we  
8       would certainly use that vehicle within those speci-  
9       fications. However, I tried to point out this morning  
10      that because we suggest that we would own an air  
11      cushion vehicle doesn't mean that that vehicle would  
12      be utilized in all cases for all contingency purposes,  
13      that we would have different types of L.G.P. vehicles  
14      available and that further than that, some of the  
15      air cushion technology can be applied to the L.G.P.s  
16      as well as to normal highway type trucks, that is  
17      air cushion assists can be put on trucks, they can be  
18      put on L.G.P. type vehicles, so that a whole range of  
19      applications is available to us, and that we don't  
20      want to make a selection or even try to decide what  
21      should best be used in a particular circumstance until  
22      close to the time when we're going to have to use it,  
23      so that we can take advantage of all of the technologi-  
24      cal advances being brought forward by the manufacturers  
25      as well as the government-sponsored group that I  
26      described to you this morning.

27                  Q      I understand all that,  
28      and perhaps I haven't made myself entirely clear.  
29      The -- all these vehicles are capable of damaging the  
30      terrain or the environment if improperly used. That's

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 obvious, isn't it?

2 A Yes.

3 Q And the manufacturer  
4 specifies the circumstances and the utilization that  
5 can appropriately be made of them.

6 A Yes sir.

7 Q Now I take it it would  
8 not be prudent in terms of the company's own resources  
9 to make uses of these vehicles that are beyond their  
10 specification.

11 A Quite correct.

12 Q And I presume further  
13 that there will be in the operations manual that we  
14 have talked about in due course, a stipulation as to  
15 the way in which these vehicles will be used by the  
16 company.

17 A Yes sir.

18 Q And your only reservation  
19 this morning was to keep open the possibility that the  
20 vehicles' permissible uses might expand as each manu-  
21 facturing processes develop .

22 A Yes sir.

23 Q But I take it that there  
24 is going to be no experimenting as such to see how far  
25 you can push these vehicles on the terrain or over the  
water.

27 A Oh yes sir, there very  
28 likely would be experimenting carried out, both  
29 by the manufacturer and by us, prior to purchasing one.  
30 Should we decide that we want to purchase a particular

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 type of vehicle, I'm certain that we would want it  
2 tested under winter type conditions.

3 Q Yes, but you're not going  
4 to -- I'm trying to be helpful because I think I under-  
5 stand what he's saying -- it's not your attempt to  
6 test out these vehicles on the terrain as you use them,  
7 because great damage can be done to the terrain if  
8 those tests fail.

9 A Excuse my density, I am  
10 missing your point. If we have a piece of equipment  
11 and we use them, the fact that we have used it on  
12 the terrain implies that it's been tested on the terrain.

13 Q Well, let me put the  
14 concern, and it's a real one, to you here. There are  
15 -- these are large pieces of equipment which can cause  
16 serious damage to terrain, if improperly used.

17 A Yes.

18 Q I put it to you that you  
19 are going to find out when you purchase them the  
20 permissible ambit of their use, the ways they can be  
21 used.

22 A No sir, I'm suggesting  
23 we'd find that out prior to purchasing.

24 Q All right, prior to  
25 purchasing, and that you won't use them in any other  
26 ways.

27 A That's quite correct.

28 Q All right, and there will  
29 be no -- and the ways they are to be used will be  
30 spelled out in the current operational manual.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 A That's right.

2 Q Yes, and there will be  
3 no high wire artists running around trying to develop  
4 and experiment new ways of using them over this  
5 sensitive terrain.

6 A With the exception of  
7 your description of our testing personnel. If we got  
8 a piece of equipment that was proven for a particular  
9 job, I see no reason why we couldn't test it for some  
10 other job to see whether or not its uses could be  
11 expanded. I think that's something that we would want  
12 to be able to do.

13 Q Well, perhaps you and  
14 I can't get together on this, Mr. Fielder, but what I  
15 was concerned to point out, and I took it to be the  
16 position of the applicant, that if this A.C.V. has  
17 never gone up, as far as you know, a 10-degree slope,  
18 you're not going to try and make it go up a 10-degree  
19 slope and risk the environmental damage that may occur  
20 if it either succeeds or fails.

21 A O.K., if the air  
22 cushioned vehicle is specified to go up an 8-degree  
23 slope and I attempted to pull it up a 10-degree slope,  
24 all that would happen is that it may or may not get  
25 up the slope. It wouldn't cause any particular environ-  
26 mental damage that I am aware of.

27 Q Well, that remains to be  
28 seen.

1                   A     No, sir, I don't think  
2 it does. I think it already has been demonstrated.

3                   Q     Other equipment can cause  
4 terrain damage?

5                   A     Air cushion -- excuse me,  
6 air cushion vehicles that I am referring to.

7                   Q     All right.

8                   A     Some of the other towing  
9 type of equipment can negotiate 50° slopes, very  
10 extreme slopes and providing that they can pull an  
11 air cushion vehicle up the slope without causing  
12 damage themselves, the air cushion vehicle is  
13 not likely to cause any damage.

14                  Q     Well, if it gets stuck it  
15 is going to have to get out of there.

16                  A     The air cushion vehicle.

17                  Q     Yes, if it doesn't make it.

18                  A     Yes, sir -- it would  
19 pick itself up on its air cushion and slide slowly  
20 back down the hill.

21                  Q     I see.

22                  A     Let me emphasize though,  
23 Mr. Scott, that any testing that is done to stretch these  
24 machines to something beyond what is specified would  
25 be done under a controlled condition. It wouldn't be  
26 done just by somebody jumping on the thing and  
27 tackling a hill.

28                  MR. GENEST: A high wire artist  
29 -- just thought that I would let you know that I  
30 was here.

1 MR. SCOTT: That was  
2 obvious, Mr. Genest.

3 Q Well, I guess we will  
4 have to leave it this way, that we will have to await  
5 the operations and maintenance manual to see then how  
6 this equipment is going to be used.

7 WITNESS HURD:

8 A Mr. Scott, we might  
9 add one more comment on the thing. The operating  
10 company contemplates the purchase of some unusual  
11 pieces of equipment and the purpose of that equipment  
12 is to allow operations to go on without damage to  
13 the terrain. Maybe the reason that we are having  
14 some difficulty understanding the point of your  
15 question is that it seems so illogical to then use  
16 that very equipment to go out and damage the terrain.  
17 Our object first of all is to avoid the damage  
18 of the terrain.

19 Q Well, I understand that  
20 is why the purchase is motivated, but everybody  
21 is familiar with the circumstances in which vehicles  
22 are pressed beyond their normal use and terrain  
23 damage can occur. I was simply trying to get a  
24 statement from the applicant that as a matter of  
25 policy that was not going to occur on this pipeline.  
26 But if it has to be left there it has to be left there.

27 Mr. Hurd, there has been in  
28 your cross-examination by the others a number of dis-  
29 cussions of what will occur in the event of a failure  
30 and the word failure has always been used in a context

1 which leads me to think of a break or a substantial  
2 leak in the pipe in respect of which it has to be  
3 shut down or immediate repairs instituted. Is it  
4 correct that the term "failure" can also cover  
5 a series of developments or occurrences at the pipe  
6 which are less serious and in which the remedy may  
7 be postponed.

8 A Yes.

9 Q For example, if you  
10 encountered a small corrosion leak on the pipe, I take  
11 it it would not necessarily follow that all your  
12 heavy equipment had to be rushed in in the month of  
13 May to repair it, that it might be possible to postpone  
14 the repair, even though that be a pipe failure until  
15 some more appropriate time of year?

16 A Yes, that is true.

17 Q Yes, so that failures  
18 first of all, failures in the integrity of the pipe  
19 can be divided into two types. First, those which  
20 would require the shutting down of the pipe immediately,  
21 and secondly, all others in which remedy can be postponed

22 A Yes.

23 Q And I take it that experience  
24 would indicate that the vast majority of so-called  
25 faliures are in the second category where remedies  
26 can be postponed for varying periods?

27 A I think that is true, Mr.

28 Scott, if all of those examples include situations  
29 where gas is escaping from the pipe itself, then  
30 both categories occur so infrequently that I don't know

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 how to judge the relationship between those two  
2 very infrequent things.

3 Q Well, how about buckles in  
4 the pipe, for example?

5 A I am sure it is possible  
6 and probably has happened. I have not been associated  
7 with any situation where a buckle occurred after the  
8 pipe was installed.

9 Q Well, now, if that is  
10 a conceivable division then of events into true  
11 emergencies and emergencies the repair of which can  
12 be postponed for varying periods of time, let us  
13 look at the true emergencies and I take it that  
14 when you have a true emergency which we may  
15 define as one which would lead to the shutdown of  
16 the pipe, there there are again two responses to  
17 it. One is to do a detailed and thorough repair and  
18 the second is to develop and apply some short term  
19 solution which will permit the continuation of gas  
20 until the full scale repair can be made in a better  
21 season.

22 A Yes, that is correct.

23 Q And I take it that it  
24 would be the policy of the applicant to utilize the  
25 second technique when environmental considerations  
26 dictated it? Where possible?

27 A Yes, where that is  
28 feasible to do, yes, sir.

29 Q And again I take it that  
30 confronted with every emergency except the emergency

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 which gives no time for thought, but confronted with  
2 every other of the categories we have discussed, is it  
3 the policy of the applicant to consult with the  
4 environmental staff that you described this morning?

5 A Yes.

6 Q And again I take it that  
7 the ultimate decision after that consultation takes  
8 place is in the hands of the district supervisor or  
9 persons above him?

10 A Yes, that is right.

11 Q And I take it that in  
12 considering the extent to which a repair situation  
13 may be postponed to a better time, you will have  
14 regard not only for environmental considerations,  
15 but also to any social or economic considerations  
16 affecting the people in the neighbourhood of which  
17 you are aware?

18 A Yes.

19 Q And I also understand,  
20 and tell me if I am wrong, they will be given  
21 equivalent weight. We are not only concerned about  
22 birds, we are also concerned about people who happen  
23 to live in the communities.

24 A Yes, indeed.

25 Q Well, now, let me take  
26 an example so -- to see if I can gauge how the  
27 applicant in a hypothetical case will respond to  
28 this kind of situation. -- You may be familiar by  
29 looking at the chart, if not otherwise, that the  
30 pipeline route crosses the Donnelly River which is

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1      between Norman Wells and Fort Good Hope and it  
2      crosses it, I think, about a mile and a half below  
      the  
3      the outlet of Chick Lake. Are you familiar with that  
4      location?

5                          A      Yes.

6                          Q      And I understand that that  
7      river is an important spawning and nursing area for  
8      grayling?

9                          A      I don't know of that  
10     of my own knowledge, but I accept it.

11                         Q      Well, let's take that  
12     as a given and I refer you particularly to P.J.  
13     McCarts, Volume XX in the Applicant's biological  
14     series in which he makes that statement. He also  
15     states, and I ask you to take this as a given, that  
16     the grayling use an area about 1 mile on either side  
17     of the proposed pipe for a period of six weeks, for  
18     spawning and hatching from May to early July and then  
19     they continue to use it as a sort of a nursery area  
20     until November.

21                         Well, now, let us into this  
22     situation pose a pipe failure such as a corrosion  
23     leak of such an extent that the gas pressure would  
24     not be maintained.

25

26

27

28

29

30

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 That is a serious leak, is it not?

2 A Yes it is.

3 Q One in which shutdown  
4 of some kind would be unavoidable if not repaired?

5 A Yes.

6 Q And let us assume that  
7 the leak occurs in the river bed during the first week  
8 of July, in the crucial grayling period. Now first of  
9 all, that event would be a true emergency, would it  
10 not? As opposed to an event, the solution of which  
11 could be postponed eight or ten weeks.

12 A It would need -- if the  
13 pressure in the pipeline was being lost, that's a  
14 serious situation.

15 Q A true emergency?

16 A Yes.

17 Q Now, is it an emergency  
18 to which you must respond by digging up the pipe, or  
19 are there other alternatives that can be applied in  
20 that situation, to ameliorate the environmental hazard?  
21 If they are, what are they?

22 A Yes, in that situation,  
23 Mr. Scott, one other alternative would be similar to  
24 the repair procedure we described in -- to question  
25 54, I believe it was, the repair at river crossings,  
26 which would be to expose the pipe on either side of  
27 the river bank, install a smaller diameter heavy wall  
28 pipe across it. I think I remember the Donnelly River  
29 at that location, its banks are reasonably high  
30 and they are not wide apart, and a smaller diameter

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 pipe, for example 42-inch, would easily span that area  
2 so a smaller diameter line could be installed as a  
3 self-supporting span between the banks and tied into  
4 the mainline at either side, and the pipeline could  
5 go into operation in a very short time. The installation  
6 --

7 Q Would it be suspended  
8 above the water? I'm sorry, I'm just trying to  
9 clarify.

10 MR. GENEST: Well, he hasn't  
11 finished.

12 A Then the installation of  
13 the permanent full diameter crossing could be done  
14 at some time of the year when there was no hazard  
15 to the fish in the river.

16 MR. SCOTT: Would that be a  
17 suspension above the water?

18 A Yes.

19 Q Now, I don't make any  
20 criticism of this because I didn't know until Dr.  
21 Fyles told me, but you and I didn't know that this  
22 location was the key spawning area for the grayling.  
23 In this situation, how are you going to find that out?

24 A Well, the description  
25 of the use that's made of the river by fish would be  
26 included in the operating manual, and the seasons when  
27 disturbance to those fish might be serious would be  
28 also in the operating manual, so we know from that  
29 source, but a repair operation that large wouldn't  
30

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 First of all, the necessity of moving heavy equipment  
2 and supplies, such as backfill or gravel, over poten-  
3 tially fairly substantial distances at unfortunate  
4 times of the year. Would you agree with that as a  
5 substantial cause of damage, if not --

6 A As a risk, potential  
7 risk.

8 Q -- a potential risk?

9 A Yes sir.

10 Q And the second potential  
11 risk we envisaged was the necessity for crossing  
12 or fording a substantial number of valleys and rivers,  
13 where the situation may be difficult because of the  
14 season, again as an area of potential risk.

15 A Yes, there are risks  
16 associated with crossing valleys and rivers, yes sir.

17 Q Well now, in reviewing  
18 your plan for dealing with these contingencies, we  
19 had two subjects of concern, I'll give them to you  
20 one following the other, and then ask you some questions  
21 about them. The first concern was the plans and  
22 procedures for getting across valleys and rivers, and  
23 in the second place, the quantity and deployment of  
24 repair equipment and vehicles. Now dealing with  
25 valleys and rivers first of all, I take it you are  
26 familiar with the Assessment Group Report which has  
27 focused on the special sensitivities of valleys in  
28 terms of construction and in terms of their location  
29 and so forth.

30 A Yes.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Q And you would agree that  
2 the same concerns -- at least in part -- will apply  
3 in terms of operation and maintenance.

4 A Yes.

5 Q Well now, in the Assess-  
6 ment Group Report they prepared a sensitivity table  
7 relating to valleys and river crossings. Are you  
8 familiar generally with that?

9 A I'm aware there was a  
10 table. I can't claim to be familiar with it.

11 Q And that in that report  
12 a number of valleys and rivers on the route were  
13 flagged as having a higher potential for damage than  
14 others and I take it that even if you hadn't seen that  
15 you would be in a position, or your people would be in  
16 a position to do precisely the same kind of thing in  
17 terms of operation and maintenance.

18 A Yes.

19 Q Well, is there any virtue  
20 in attempting, in your repair operation, to develop  
21 special procedures that are related, let us say, to  
22 10 or 15 valleys?

23 A Oh, I see. Mr. Scott,  
24 we described earlier that the operations and maintenance  
25 manual would include contingency plans which would be  
26 applied to specific sections of the pipeline in the  
27 event that a break or some repair procedure was  
28 necessary within that section. Each of those plans  
29 probably would be different from the others, and each  
30 would include descriptions or instructions on which

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 equipment would be -- could be taken from which  
2 location, how it would travel to that location, and  
3 it would take into account sensitivities that might  
4 exist in one season but not in another, and so it would  
5 deal with it season by season. So those, I think  
6 we're saying the same thing except that I'm suggesting  
7 that rather than isolating valleys by themselves, and  
8 describing procedures for crossing them, I'm saying that  
9 for a contingency repair plan that the crossing of  
10 sensitive valleys would be included within that plan.

11 Q Yes, but as you reviewed  
12 the matter you'd have no trouble in listing a series  
13 of valleys and rivers which, if you had to cross, are  
14 either going to be difficult to cross or run a high  
15 risk of potential environmental damage.

16 A Certainly we could  
17 list the valleys, yes.

18 Q Now, would you propose  
19 to try and develop special solutions on a seasonal  
20 basis, if you want, for each of those valleys?

21 A Yes indeed.

22 Q What sort of special  
23 solutions would you have in mind?

24  
25  
26

27  
28  
29

30

1                           A     To deal with the  
2 season in which the terrain is most sensitive we would  
3 determine whether or not the vehicles, the low  
4 ground pressure vehicles that are available to the  
5 operating company can cross the valley following the  
6 right-of-way. If they could not, a route that  
7 differed from the right-of-way would be selected and  
8 this would be done well ahead of when the need  
9 arose.

10                          Q     Are you thinking there  
11 of an access road of some type?

12                          A     Yes.

13                          Q     Would that be a  
14 permanent access road? -- For that valley?

15                          A     Whether it would be  
16 gravel covered or not is a different question. It would  
17 be there permanently. Its object is to provide a  
18 routing for, for example, an air cushion vehicle that  
19 allows it to go down slopes that are gentle enough  
20 that can be handled and to cross the river at some  
21 other location and come back to the right-of-way and  
22 proceed along it from there.

23                          Q     What other kinds of  
24 solutions might you want to consider at those high  
25 risk valleys and rivers?

26                          A     We'd examine pretty  
27 carefully the use that might be made of helicopters,  
28 large helicopters that have a good heavy sling load  
29 capability, so that we would stay off the ground  
30 entirely, that is probably the first thing we'd look

1 at.

2 Q Might you give any  
3 consideration to stockpiling bridge units, for example,  
4 at particularly difficult rivers?

5 A We hadn't considered to  
6 my knowledge stockpiling -- did you call them  
7 bridge units?

8 Q Yes.

9 A That equipment is trans-  
10 portable and could be moved from locations which  
11 would be selected so that they are near these sensitive  
12 valleys. Crossing the river itself is a question a  
13 little different than getting down the slopes on  
14 either side.

15 Q Well, then coming onto  
16 that would you consider for example, stockpiling supplies  
17 and equipment on both sides of particularly difficult  
18 rivers and valleys so there would be no necessity  
19 to cross them with heavy equipment and supplies?

20 A To a large extent that  
21 is included, yes--

22 Q Yes.

23 A -- in the plan. For  
24 example, replacement pipe which would be stored along  
25 the right-of-way at intervals -- those storage sites  
26 would be selected keeping in mind that if a break  
27 occurred at a certain location then we want to avoid  
28 having to cross a river with that very heavy load.

29 Q Well, then do I have  
30 it this way that as you proceed to your contingency

1 manual, you will agree with me that it will be one  
2 of its functions to try and isolate rivers or valleys that  
3 are potentially hazardous or that risk environmental  
4 damage at certain or all seasons?

5 A Yes, I think we are  
6 saying the same thing. A plan would be devised having  
7 in mind that certain valleys are sensitive and  
8 would be designed to avoid crossings of those  
9 wherever possible.

10 Q And you will have a  
11 range of potential solutions that will be designed for  
12 that particular valley or perhaps one or more that  
13 will obviate the necessity to cross it or provide for  
14 an easy crossing of it.

15 A Yes.

16 Q And I take it that all  
17 that work essentially remains to be done?

18 A The detailed plan for  
19 each section of the line, yes, sir, remains to be  
20 done.

21 Q Well, now, the second  
22 issue was deployment of equipment and I understand that  
23 the deployment that you have shown on the charts is as  
24 yet tentative, is that correct?

WITNESS FIELDER:

25 A Yes, sir.

26 Q But I also understand that  
27 it does reflect the -- your present view as to the  
28 overall number of pieces of equipment that you would  
29 expect to have?

30 A Yes, sir, in general that

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 is the case.

2 Q You agree with me that  
3 obviously more equipment, if more equipment is purchased,  
4 it may indeed reduce the necessity of travelling with  
5 it over longer distances.

6 A Properly deployed, that is  
7 quite correct.

8 Q Yes. Isn't that a  
9 desirable kind of insurance, even though it may  
10 never be used?

11 A Should we find the  
12 situation that you described to Mr. Hurd a  
13 few moments ago that most certainly would be the  
14 case.

15 Q So I take it that you have  
16 not ruled out the purchase of additional equipment if  
17 as a kind of environmental insurance it should be  
18 seen to be desirable?

19 A No, sir, the selection  
20 of the type of equipment and the number of pieces of  
21 each type of equipment and their location will have  
22 to be made not considering either of those parameters  
23 in isolation. They all have to be looked at together  
24 in conjunction with the sort of sensitivity problems  
25 that you just mentioned and we will learn a lot  
26 about that as the design of river crossings takes  
27 place because a lot of the information that you have  
28 just described as being necessary knowledge for  
29 O and M purposes, will also be necessary in order  
30 to have a river crossing properly designed and constructed.

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1                           Q     Yes, but I take it that  
2 the issues that are at play when you come to consider  
3 how much equipment you will purchase for repair work,  
4 are first of all, cost on one side and on the other  
5 side, security of the pipe from the owner's point of  
6 view and secondly, environmental protection.

7                           A     Not necessarily in  
8 that order, but certainly they are all parameters.

9                           Q     And that there is  
10 therefore no determination that the number of units  
11 and the kind of equipment you selected is necessarily  
12 fixed.

13                          A     That is quite correct.

14                          A     Should we find, for example  
15 that two sensitive river valleys isolates a portion  
16 of our pipeline that we could not get to from the  
17 stations on either side, then the sorts of considerations  
18 that you and Mr. Hurd have been discussing would come  
19 into play and perhaps the solution would be to store  
20 some other equipment between those two river valleys --

21                          Q     Well, that deals mainly --  
22                          A     -- however  
23 answer as well.

24                          Q     That situation deals  
25 with a case in which access cannot be obtained, would  
26 you agree with me that if you found that access could  
27 only be obtained at high environmental risk in the  
28 same way you would be prepared to go to the purchase  
29 of more equipment and store it somewhere conveniently  
30 so that you would not be exposed and we will not be

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 exposed to that risk.

2 A      Absolutely. I was not  
3 separating the two.

4 Q      Because one of the  
5 things that concerned me is that if you look at the  
6 spacing of equipment on parts of the route it seems  
7 to be extremely random and without any regard to any  
8 principle that I can divine.

9                  For example, if you take the  
10 section between Travaillant Lake Junction and Fort  
11 Good Hope, there are four compressor stations, one  
12 is M-03 and that is a good one because it has got  
13 a 6,000 foot airstrip and fifteen vehicles. The  
14 next is M-04 which is a 6000 foot airstrip, three  
15 vehicles. M-05 has a 2,400 foot airstrip and four  
16 vehicles and M-06 has a helipad and nothing else and  
17 twelve vehicles.

18                  Now, if I read that chart  
19 right I frankly do not understand the principle  
20 upon which the equipment has been deployed and  
21 stationed in that fashion. Is there any principle  
22 there that I should refer to?

23                  A      Generally it refers to  
24 access via the highway system.

25                  Q      What highway system?

26                  A      We are talking about the  
27 highway, the Dempster Highway south of Inuvik.

28                  Q      I see. Well, let me  
29 ask you this. Why would it be, for example, that at  
30 a station where you have merely a helipad you have

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1       stationed twelve vehicles, that is, M-06   Whereas, one  
2       where you have a 6,000 foot airstrip you have only  
3       stationed three?   M-04.

4                             A       Sir, without the  
5       maps I find it difficult to answer you specifically,  
6       but in general I gave last time would be the  
7       answer, that there are other means of accessing that  
8       part of the right-of-way than from the equipment  
9       that has to be stored at the sites.

10                          Q       Well, doesn't that assume  
11      that the Mackenzie Highway was built?   We are  
12      talking about the area between Travallant Lake and  
13      Fort Good Hope.

14                          A       No, sir, the assumption  
15      was that the Mackenzie Highway would be built to  
16      Fort Good Hope, as I recall, and that the Dempster  
17      Highway coming down south is completed,   coming  
18      down south from Inuvik is completed.

19                          Q       Yes, but is your contingency  
20      plan based on the completion of those two highways?

21                          A       The contingency plan will  
22      be based on whatever is completed at the time that  
23      the contingency plan is put together, sir.   We have  
24      not prepared one as yet.

25                          Q       Well, if your pipeline  
26      were built today and you had to be operational tomorrow  
27      I take it that the deployment of equipment between  
28      M-03 and M-06 that you have listed would have to be  
29      totally rearranged.

30                          WITNESS HURD:

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 A Mr. Scott, that is  
2 fair enough if we assume that the pipeline is built today  
3 to assume that the highway is built today.

4 Q Gee, I hope that the  
5 applicant has a better chance than the highway people --  
6 no, but you have shown us a list of deployed vehicles.  
7 Do I understand that that list would be totally in-  
8 appropriate if the circumstances that exist today  
9 exist when your contingency plan is to go into effect?

10 WITNESS FIELDER:

11 A No, sir, it would not  
12 be totally appropriate --

13 Q Largely appropriate.

14 A It is based on a  
15 certain set of ground rules and if those ground  
16 rules change then certainly the selection and deployment  
17 of equipment will change to suit.

18 Q In any event, this deployment  
19 that you have presented to us is based on the completion  
20 of those two highways?

21 A To the points that I  
22 have mentioned, yes,

23 Q Yes.

24 What you are calling the  
25 Dempster Highway and confusing me is in fact now part  
26 of the Mackenzie Highway that goes from Hay River  
27 to -- or the designed Mackenzie Highway that goes  
28 from Hay River to Inuvik, isn't it?

29 A I did not think so, sir,  
30 it seems to me that that is the highway that has

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 already been at least partially constructed coming  
2 south out of Inuvik. Am I confused or are we  
3 both confused?

4 Q Well, I am certainly  
5 confused.

6 WITNESS HURD:

7 A I think, if I can  
8 add a little bit, the Dempster Highway being  
9 ahead of the other in time comes from the southwest  
10 past McPherson and crosses the river and goes on  
11 up to Inuvik and it continues to be called the Dempster  
12 Highway in that area. The Mackenzie Highway coming  
13 from the south will connect with it near the south  
14 end of the delta.

15

16

Fielder, Hurd, Carlson  
Cross-Exam by Scott

1 Q In that context, the  
2 Mackenzie Highway stops at that point, then it becomes,  
3 if you will, the Dempster Highway.

4 A I think that's been the  
5 common usage.

6 THE COMMISSIONER: It doesn't  
7 stop there, it's got to get there first.

8 MR. SCOTT: Dr. Fyles tells  
9 me they have officially changed the name, but I think  
10 our situation is clear.

11 Q But I take it that this  
12 deployment of forces is based on that kind of  
13 assumption and as you move toward the actual deployment  
14 there may be all kinds of changes.

15 A That's quite correct.

16 Q So that there is no point  
17 in us attempting to examine whether the placement of  
18 15 trucks at M-05 is suitable or not, because it all  
19 depends on whether the highway is going to be built.

20 A Not only that, sir, but  
21 as we've said before, there may be completely different  
22 types of equipment may be available within that  
23 period of time, and hence change.

24 MR. SCOTT: I think those  
25 are all the questions I have. Thank you, Mr. Commis-  
sioner. Thank you, Mr. Hurd.

27 MR. GENEST: No re-examination,  
28 Mr. Commissioner.

29 THE COMMISSIONER: Well, that  
30 completes the evidence of this panel, and Mr. Hurd and

1 Mr. Fielder and Mr. Carlson, I want to thank you for  
2 coming and for being so patient with all of us in  
3 answering questions. You're excused.

4 (WITNESSES ASIDE)

5 THE COMMISSIONER: Mr. Genest,  
6 I'm in your hands. You have Mr. Horte giving evidence,  
7 I understand. Do you want to start now? You're welcome;  
8 if you want to wait until nine in the morning, that's  
9 all right, too. I'll leave it up to you.

10 MR. GENEST: I think we'd  
11 like to start now, sir. I wonder if we could have a  
12 five-minute break to get the --

13 THE COMMISSIONER: Yes, cer-  
14 tainly, let's do that.

15 (PROCEEDINGS ADJOURNED FOR FIVE MINUTES)

16 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

17 MR. GENEST: Mr. Commissioner,  
18 as you can see, our next witness is Mr. Horte, who is  
19 the president of Canadian Arctic Gas Pipeline. I  
20 thought I should say, sir, before reading the examina-  
21 tion in chief that Mr. Horte is being called in rela-  
22 tion to matters pertaining to Phase 1 of these hearings,  
23 and also to answer some of the specific concerns posed  
24 by you, sir, and be available for cross-examination  
25 to some of the parties who didn't get as far as they  
26 wanted with some of the consultants. I want to empha-  
27 size that Mr. Horte will be recalled at a later  
28 stage to deal with policy matters arising out of  
29 subsequent phases of these hearings, and I thought I  
30 should state this at the outset so that the impression

V.L. Horte  
In Chief

1 will not be created amongst the participants that  
2 this is the only chance they have to cross-examine  
3 Mr. Horte. I will be asking you, sir, I hope that  
4 the need for any ruling will not arise but I want to  
5 give notice that I will be asking that the cross-examination  
6 should be reasonably limited to matters properly per-  
7 taining to Phase 1 of the hearings.

8 With that I wonder if I  
9 might ask if Mr. Horte could be sworn?

10  
11 VERNON L. HORTE, sworn:

12 DIRECT EXAMINATION BY MR. GENEST:

13 Q Mr. Horte, you are the  
14 president of Canadian Arctic Gas Pipeline Limited.

15 A Yes sir.

16 Q And also of Canadian  
17 Arctic Gas Study Limited.

18 A Yes.

19 Q These are sister companies,  
20 are they?

21 A Yes.

22 Q And I understand, sir,  
23 that you're also the vice-chairman of the Alaskan  
24 Arctic Gas Pipeline Company and the Alaskan Arctic  
25 Gas Study Company.

26 A Yes, I am.

27 Q And you were born in  
28 Kingman, Alberta in 1925.

29 A Yes, I was born then.

30 Q How far is that from

V.L. Horte  
In Chief

1 Mr. Gibbs' place?

2 A I'm not sure, about 200  
3 miles, I think.

4 Q And I understand that  
5 you served in the Second World War with the Royal  
6 Canadian Air Force.

7 A Yes.

8 Q And dealing with your  
9 education, sir, you attended the University of  
10 Alberta where you obtained a B.Sc. in Chemical  
11 Engineering in 1949.

12 A Yes.

13 Q And you began your  
14 working career -- I shouldn't say that, students will  
15 be upset -- you began your career with the Chemical  
16 & Geological Laboratories in Edmonton, after which you  
17 joined the Alberta Energy Resources Conservation Board  
18 as a gas engineer. Is that right?

19 A That's correct.

20 Q And you remained in that  
21 capacity until 1952.

22 A Right.

23 Q From 1952 to 1957 you  
24 were with DeGolyer and MacNaughton, who are well-known  
25 petroleum consulting engineers in Dallas, Texas.

26 A That's correct.

27 Q And in 1957 you joined  
28 Trans-Canada Pipelines Limited as chief gas supply  
29 engineer.

30 A Yes sir.

V.L. Horste  
In Chief

1 Q You were appointed vice-  
2 president of gas supply of that company in 1961.

3 A Yes.

4 Q You were appointed  
5 group vice-president responsible for gas sales, gas  
6 supply, and planning departments of Trans-Canada  
7 Pipelines in 1966.

8 A That's right.

9 Q And you became president  
10 of Trans-Canada Pipelines in 1968, is that correct?

11 A Correct.

12 Q And you remained in that  
13 position until you joined this project in 1972.

14 A That is correct.

15 Q And perhaps I neglected,  
16 Mr. Commissioner, to file what we have usually done  
17 with each witness, is to file his qualifications. Per-  
18 haps that could be given the next exhibit number.

19 (MR. HORTE'S QUALIFICATIONS MARKED EXHIBIT 127)

20 Your professional and  
21 business affiliations are shown in that exhibit, Mr.  
22 Horste.

23 A They are.

24 Q You're a professional  
25 engineer, you're a director of the Canadian Gas  
26 Association, director of the National Trust Company,  
27 and a member of the American Gas Association, etc.

28 A Yes.

29 Q May I ask you then, Mr.  
30 Horste, to go to the summary of your testimony in chief

V.L. Horte  
In Chief

1 and to give us the history of the development of the  
2 Arctic Gas project, and your association with it, and  
3 perhaps before you go on, Mr. Commissioner, this will  
4 be, I'm sure, ancient history to a number of people  
5 associated with the project, but I thought it would be  
6 useful at some time in these hearings to have that  
7 on the record. Mr. Horte will deal not only with that  
8 but with the internal organization and decision-making  
9 process in the company. Will you proceed, please,  
10 sir?

11 A Very well.

12 Mr. Chairman, my first  
13 association with this project goes back to 1967  
14 during my employment with Trans-Canada Pipelines, when  
15 Trans-Canada, Michigan Wisconsin Pipe Line Company,  
16 and Natural Gas Pipe Line Company of American first  
17 commenced studies to determine the feasibility of  
18 constructing a pipeline into the southern part of  
19 the Northwest Territories, namely the Beaver River-  
20 Pointed Mountain area, where it was considered the  
21 potential existed for major discoveries of natural  
22 gas.

23 During the course of these  
24 studies it became apparent that the potential in this  
25 area appeared unlikely to be large enough to support  
26 such a pipeline. With the discovery of the Prudhoe  
27 Bay field in Alaska in 1969, however, it was decided  
28 to extend the initial studies by investigating the  
29 feasibility of a pipeline to connect with this area.  
30 Subsequently, in 1970 the three major producers in

V.L. Horte  
In Chief

1 Prudhoe Bay, namely, Exxon, SOHIO and ARCO, joined in  
2 these studies and these six companies then formed what  
3 was known as the Northwest Project Study Group. This  
4 group had a common interest in assessing the feasibility  
5 of transporting gas from Prudhoe Bay and the Mac-  
6 kenzie Delta, where exploration was then taking place,  
7 to U.S. and Canadian markets.

8 About the same time as the  
9 formation of the Northwest Project Study Group, another  
10 study group known as the Gas Arctic Systems, was formed  
11 with similar objectives and both groups then carried  
12 on their independent studies until June, 1972. At  
13 that time the two groups joined forces to form what  
14 then became known as the Gas Arctic-Northwest Project  
15 Study Group. The number of participant companies  
16 in the two independent study groups totalled 12, and  
17 upon their joining forces, additional participant  
18 companies were added to the new study group. The  
19 study group was set up on a basis whereby any company  
20 with an interest in the project would have the right  
21 to become a member simply by paying its share of the  
22 costs incurred by the study group. All studies made  
23 by the independent study groups at the time of their  
24 joining together were pooled and the costs for work  
25 done independently were picked up by the new group on  
26 a basis whereby each participant paid an equal share.

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

V.L. Horte  
In Chief

With the formation of the

Gas Arctic/Northwest Project Study Group the participant companies decided to employ a full time management and staff to control and supervise numerous studies required to determine the viability of the project. The staff was also charged with the responsibility of preparing the necessary data required for filings before the appropriate regulatory authorities if as a result of these further studies it proves sound to do so.

In September of 1972 Mr.

Wilder and I were employed as Chairman and Vice Chairman respectively of the study group, and as Chairman and President of Canadian Arctic GAs Study Limited which was formed to carry out this task in Canada for the Gas Arctic/Northwest Study Group.

We subsequently have been responsible for hiring the other members of the management team and the staffing of the organization. An Alaskan Arctic Gas Study Company was also formed and Messrs. Ward and Mathews hired as President and Executive Vice President respectively of that company. They along with a small staff managed the operations of this company in Alaska.

Mr. Wilder is also Chairman of the Alaska Arctic/Gas Study Company. Mr. Brackett and myself are Vice-Chairmen of this company, thereby providing continuity and consistency in the overall approach to the project in Alaska and Canada. The studies undertaken in Canada and Alaska have mainly been done and performed by the same consultants so as

1 to provide a common and consistent approach, with  
2 special consultants being utilized in Alaska and in  
3 Canada to handle and deal with particular aspects and  
4 problems unique to each area. Canadian Arctic Gas  
5 Study Limited with its sister company, Alaska Arctic  
6 Gas, referred to jointly as Arctic Gas, have been  
7 responsible for the studies prepared on behalf of the  
8 study group and for the preparation of the applications  
9 submitted to the Department of Indian and Northern  
10 Affairs which is now before this Inquiry and for  
11 applications filed with the National Energy Board and  
12 in the United States, the Federal Power Commission and  
13 the Department of the Interior.

14 Now, those applications themselves  
15 are filed by -- in the name of the pipeline companies  
16 in each respective jurisdiction, namely Canadian  
17 Arctic Gas Pipeline Limited in Canada and Alaska  
18 Arctic Gas Pipeline Company in the State of Alaska --  
19 or in the United States.

20 In carrying out its function,  
21 Arctic Gas has through its own staff and through  
22 the use of numerous consultants, worked under our  
23 supervision--and through the use of numerous consultants  
24 working under our supervision, prepared this  
25 material. We have operated with a relatively small  
26 staff with most of the detailed work being assigned  
27 to numerous consultants working under our supervision.  
28 The Management of Arctic Gas is responsible to the  
29 participant companies who have set up a management  
30 committee which operates in a manner very similar to

V.L. Horte  
In Chief

1 a Board of Directors. Each participant company is  
2 represented by a member on this management committee.  
3 The Management Committee meets monthly either in  
4 total or through an executive committee appointed  
5 by the Management Committee to review the progress  
6 of the project.

The broad policy of Arctic  
Gas is decided by the Management Committee. Within  
the policy guidelines the company management  
operates. The Management Committee is organized into  
three groups. One is Canadian non-producing companies,  
that is the Canadian transmission and distribution  
companies and Canadian companies that simply have  
a financial interest.

The second group we call the U.S. non-producing companies. It consists of U.S. transmission and distribution companies. Finally, there is the producer group. This consists of the Alaskan and Canadian producers. This grouping is reflected in the arrangements for voting. The agreement to which all members of the Consortium are party provides that no decision may be made without a two-thirds majority vote from each group. This ensures that no one group dominates the Management Committee.

25 The Canadian non-producers group  
26 consists of:

27 TransCanada Pipelines Limited

28 : Alberta Natural Gas Company Ltd.

## 29 | Canada Development Corporation

30 Consumers Gas

1 Union Gas

2 Northern and Central Gas Corporation Limited.

3

4 The U.S. non-producers group consists of:

5 Northern Natural Gas

6 Michigan Wisconsin

7 Natural Gas Pipeline

8 Texas Eastern Transmission

9 Panhandle Eastern Pipe Line

10 Pacific Lighting Gas Development Company

11 The Columbia Gas Transmission Corporation.

12

13 The producers' group consists of:

14 Imperial Oil

15 Gulf Canada

16 Shell Canada

17 Canadian Superior

18 Atalntic Richfield Company

19

20 The agreement provides that the participants may go and

21 others may join and this has happened. Companies that have

22 withdrawn are:

23 Transcontinental Gas Pipe Line Corporation

24 Canadian National Railways

25 The Alberta Gas Trunk Line Company

26 The Standard Oil Company (Ohio)

27 Colorado Interstate Gas Company

28 Pembina Pipe Line Limited.

29 Exxon Company U.S.

30 Canadian Pacific

Canadian Utilities

1                   Numac Oil and Gas Limited/Sunoco E & P Limited.

2                   Now, the members of the  
3 consortium have an influence in the decision making  
4 process of the Study Group in another way beyond  
5 just the direct influence through the management committee.  
6 You will appreciate that there is a very considerable  
7 body of experience represented by the companies that I have  
8 mentioned. We have formed Committees that have  
9 enabled our consultants and advisors to obtain the  
10 benefits of that advice, which represents an important  
11 cross-section of the natural gas industry of North America.  
12 Technical, Environmental, Financial, Legal and Public  
13 Affairs Committees have been designated by the Management  
14 Committee for the purpose I have just outlined. These  
15 committees often appoint sub-committees to review areas in  
16 which they have particular expertise. This organization  
17 I have described will of course be superceded by the  
18 usual type of organization where control is exercised  
19 through a board of directors when construction commences.  
20 When the project is financed.

21                   I would like now, just to  
22 briefly the organization chart for our present  
23 organization and we have a view graph here which  
24 would be helpful.

25                   This is the present organization chart  
26 for Canadian Arctic Gas Study Limited and represents  
27 the organization as we see it. Now, in these  
28 broader terms that will be the organization utilized  
29 during the construction phase of the project.

V.L. Horte  
In Chief

Starting at the top of course the  
Chairman and Chief Executive officer below which the  
President and reporting to the president the  
-- those shown on the first line in their very  
functional areas. Vice-President of Finance,  
Operations, Engineering and Construction, General  
Manager of Employee and Public Relations and our  
Vice-President and General Counsel.

Now, I don't intend to go through all of the positions shown on this organization chart, but I think in particular it would be helpful to review with you in a bit of detail the positions under the two headings Vice-President of operations and Vice-President of Engineering and Construction as those are very key in terms of the subjects being discussed before this Inquiry.

I will just mention starting  
on the left hand side under the Vice President of  
Finance, however, I think most of the titles shown  
there are self-explanatory as to why they would  
report to the Vice-President of Finance, down the  
second column, the second block from the bottom you  
will see the Manager of Administration for the  
Calgary Office. This is simply because of convenience  
that the administrator in the Calgary office reports  
to the controller in the Calgary office.

27 One other point and just  
28 to the right of that on the bottom block you will  
29 see Economic Advisor, and if you follow the line  
30 up you will see that the Economic Advisor reports to the

1 Treasurer. It was just shown this way to make room  
2 on the chart. The Economic Advisor also happens  
3 to be the same person who has in our studies had  
4 a great deal to do with the economic impact of the  
5 project in the Northwest Territories and also on  
6 the overall Canadian economy as well as being very  
7 much involved in the socio-economic considerations  
8 in the Territories.

9 Going to the next, functions  
10 under the Vice-President of Operations, the first  
11 block, I think is self-explanatory, this is simply  
12 the director of operations and maintenance who will  
13 be the man of direct line and responsibility for  
14 operations and maintenance.

15 The next column, the Director  
16 of Environmental Protection and Community Relations.  
17 I would like to mention that while this position is  
18 shown as reporting to the Vice - President of Operations,  
19 during this phase in our planning he has reported in  
20 a dual role and probably to a greater extent has liaison  
21 and worked with the engineering and construction people  
22 with the environmental inputs. He reports in the  
23 direction shown fundamentally because this is an  
24 ongoing position as we see it where in addition to the  
25 environmental input to the actual engineering and  
26 construction, there will be a continuing role during  
27 the operations and over the life of the project in  
28 this area.

V.L. Horte  
In Chief

## The community relations

also handled by this director are handled in that manner fundamentally because No. 1, the person involved his own, and if you like interest or feel for this area, plus the fact that we feel that the environmental and the sociological considerations are very much related, and that by these two functions really reporting to this one man, we feel that that will provide better co-ordination . As you can see below that, this man will have a manager for Northern Affairs, or on the socio-logical aspects of things reported to him. He will have a manager of environmental protection, and the last block shown is a manager of northern business planning. This is a position that, as we see the project developing, more and more emphasis will -- it is an area where more and more emphasis will be required in that this will be our man charged with liaisoning with the communities, the various levels of government to develop plans to make sure that there is participation in the north, and that opportunities are made available not only in the employment area but in the actual business community in the north and the development of that business community.

Going to the next main heading on the chart, the vice-president of engineering and construction, and reporting to him the director of labor relations, and I think I might take a moment there, to explain that the director of labor relations is shown reporting here rather than to the manager of

V.L. Horte  
In Chief

1 employee relations simply because this man will be  
2 dealing more directly with those labor relations  
3 associated with the large pool of labor that will in  
4 fact be employed by the contractors to a great extent  
5 on the project. The union problems and other problems  
6 that are associated with that, so his -- this will be  
7 his main function. Obviously this will be co-ordinated  
8 very closely with our overall employee-relations  
9 policies, but is somewhat different than the longer  
10 term employee-relations problem in that it's parti-  
11 cularly geared to this construction phase and the  
12 large number of people who will be involved with the  
13 contractors.

14 The next heading, I think, is  
15 self-explanatory, is the director of procurement, and  
16 really he'll be director of procurement and logistics,  
17 the man responsible within the company for negotiating  
18 the terms of our material supplies, etc., and assuring  
19 us that in fact these supplies will be available when  
20 required, in the most expeditious and the lowest  
21 cost method possible.

22 The manager of budgeting and  
23 planning, shown immediately below that, is not an  
24 overall corporate manager of budgeting and planning,  
25 but simply the budgeting and planning associated with  
26 construction itself.

27 The next man or the next  
28 position, really, I don't believe requires explanation.  
29 This is the director of construction, the man who will  
30 be directly responsible for the construction aspects.

V.L. Horte  
In Chief

Immediately below that is director of engineering, who will be directly responsible for the engineering design aspects of the project.

Below the director of engineering you can see is assistant director of engineering, technical services, assistant director of engineering facilities, and below them many other managers assisting the director of engineering, and off to the right on the two blocks shown, similar assistants to the director of construction, and many, many other managers which will be required below them.

With respect to the -- those positions reporting to the general manager of employee and public relations, I really think those are quite straightforward and I only make the comment again that as a matter of convenience, the manager of administration, shown in the lower block, for the Toronto Office, reports to this manager.

On the far right, those positions reporting to the vice-president and General Council, I think, are all self-explanatory. Unless there are any questions at this time -- but I guess we'll deal with those later.

MR. GENEST: Sir, I have a printed copy of that. You might like it filed as an exhibit.

THE COMMISSIONER: Yes, please.

(PERSONNEL STRUCTURE MARKED EXHIBIT 128)

MR. GENEST: Perhaps, Mr.

Horte --

V. L. Horte  
In Chief

1 THE COMMISSIONER: Excuse me,

2 Mr. Genest. Miss Hutchinson, you might have copies  
3 made and distributed.

4 MR. GENEST: Sir, I have some  
5 but we've just mislaid them, and I'll find them  
6 within the next half-hour.

7 Q I'm going to move on now,  
8 sir, to sort of miscellaneous subjects because they  
9 arose during the course of the hearings, and the first  
10 one I want to deal with is the question of pipeline  
11 sizing, and the process by which you arrived at a  
12 decision, Mr. Horte, to propose the use of a 48-inch  
13 pipeline at the pressures about which we've been  
14 hearing. Could you deal with that, please?

15 A Yes sir.

16 In determining the size of  
17 the pipeline, it became apparent at the outset, when  
18 one considers the distance over which the gas would  
19 have to be moved, that a very efficient system would have  
20 to be designed and constructed if the project was to be  
21 economically viable. Generally, providing gas volumes  
22 are available to justify its sizing, the larger the  
23 diameter of a pipeline the more efficient or more  
24 economical the transportation of gas through such a  
25 pipeline becomes. This, of course, is also a  
26 function of the pressure at which the pipeline will be  
27 operating, but given common pressures the larger you  
28 can go on diameter, providing you have gas volumes to  
29 justify it, the more economical the facility. With  
30 this as a basic criterion, and the further criterion

V.L. Horte  
In Chief

1 of the line being designed, so that it was capable of  
2 being constructed with existing technology, we arrived  
3 at a conclusion that a 48-inch diameter high pressure  
4 system operating at 1,680 pounds was the most efficient  
5 system. Our studies showed that such a pipeline operat-  
6 ing at fully powered capacity would be capable of  
7 moving 4.5 billion cubic feet of gas per day.

8 Obviously, such a system would  
9 not be viable if the volumes of gas available from the  
10 Alaska North Slope and Mackenzie Delta were not  
11 sufficiently large. Our review of the situation ind-  
12 icated that volumes of 2 to 2 1/4 billion cubic feet  
13 per day or larger would be available from the then  
14 discovered Prudhoe Bay area in Alaska where reserves  
15 are estimated at about 24 trillion cubic feet, and that  
16 the future potential of this area was also large.

17 It was judged that one could  
18 reasonably count in the near term on volumes of gas  
19 from the delta on the Canadian side of one to 1 1/4  
20 billion cubic feet per day, and again that additional  
21 volumes were likely to be developed thereafter.

22  
2324  
2526  
2728  
29

30

V.L. Horte  
In Chief

Assuming the demand exists,  
the key to the feasibility of any project, of course,  
is not necessarily the ultimate volumes that may be  
available in an area, but the initial volumes which are  
demonstrated to be proven and available to support the  
initial financing of the project if in fact no other  
reserves were discovered. In this connection our  
studies indicated that feasibility would be assured  
with the initial volumes from both sources indicated  
of three to 3 1/4 billion cubic feet per day. We  
expect, having regard to the high potential of both  
areas, that the project starting at that level of throughput  
would in a few years be operating at its full  
capacity of 4 1/2 billion cubic feet per day.

Now in connection with the  
sizing of the pipeline, a question has often arisen  
in connection with the sizing of the northern laterals  
themselves, whereby they are, as you know, both  
sized at a 48-inch diameter as well as the 48-inch  
diameter for the main line. So that if you have  
two of these 48-inch diameter pipelines coming together  
ultimately the capacity of the two lines would be up  
to nine billion cubic feet per day. Now two major  
considerations went into this decision. These were the  
impact on the environment and the economic feasibility  
of the project. The potential of the North Slope  
and the delta made it seem quite realistic to look  
forward in the long run to a throughput of 4.5 B.C.F.  
per day from each of the producing areas. This alone  
justified building in future capacity, but perhaps not

V.L. Horte  
In Chief

1 to a 48-inch size on the basis of economics alone.  
2 But there was the further consideration -- the  
3 environmental consideration. Over-sizing in this  
4 sensitive northern area would reduce the necessity  
5 for future work associated with expansion in those  
6 areas. It seemed to us that the combination of these  
7 factors justified over-sizing these supply laterals  
8 particularly since the overall economics of the  
9 project as a whole would support this over-sizing.

10 Q Could I ask you to  
11 explain that a little, Mr. Horte? You say the economics  
12 of the project as a whole

13 A Well, when we look at the  
14 total cost of the project, including those two 48-inch  
15 laterals, and the cost of service associated with that,  
16 it is our estimation that the economics of transportation  
17 are such that gas will land on the market place on a  
18 truly competitive basis with any other form of energy  
19 now being looked at in the market place. The only  
20 other thing I could say, if you sized in the initial  
21 years those lines down to a lesser size, let's say  
22 42-inch, it would improve the early year economics.  
23 Whether in the long run on a straight economic basis  
24 it would prove to have been the right decision or not,  
25 is something we'll only know after the fact because  
26 if the buildup of volumes were rapid, then one would  
27 find that the 48-inch diameter would certainly have  
28 been a wise decision on the basis of economics alone.  
29 Whereas if the buildup were slow, the economic  
30 decision would probably favor the 42-inch system; but

V.L. Horte  
In Chief

when we combine the two, having regard to the environmental aspects, the project could, in our opinion, on the total basis demonstrate economic feasibility, we chose this course.

Q Well, I interrupted you, Mr. Horte. You were, I think, going to expand on the environmental aspect, which is, as you say in your statement, to delay additional work or looping in the sensitive northern area.

A Well, to the extent that you have additional capacity available in the initial system, it certainly means that as additional reserves are developed, less looping will be required by that over-sizing.

These, then, are the reasons for the selection shown in the original filing. Subsequently, as you know, we have also filed, as I've mentioned, an alternative proposal showing these two laterals sized down to 42-inch diameter systems operating at the same high pressure. This was done so that a comparison could be made of the costs, and the effects therefore of smaller size laterals. While there are some immediate financial savings, as I have mentioned to the 42-inch line, we prefer at this time the 48-inch laterals. If the rate of discovery in the delta proved disappointing, or if costs escalated beyond our present expectations, which might change that overall economic consideration, then it could be desirable to opt for 42-inch laterals. For these reasons we felt that alternative should be considered by the regulatory

V.L. Horte  
In Chief

1 authorities and this Inquiry in the first instance.

2 Q When is the decision,  
3 Mr. Horte, relating to the size of the laterals, likely  
4 to be made, in your present judgment?

5 A Well, certainly once the  
6 approvals are obtained and we have the benefit at  
7 that time of a further evaluation of the economics,  
8 once we have firm bids on various parts of the  
9 project and aspects of the project, we have an addi-  
10 tional assessment as to the reserve situation, what's  
11 happened in the meantime, then would be the time.  
12 you order  
13 Obviously you have to make it before your pipe and  
14 equipment can proceed to get on the ground.

15 So it would be shortly after  
16 the regulatory approval.

17 THE COMMISSIONER: You've said,  
18 Mr. Horte, that sizing depends on a number of things,  
19 but one of them was the extent of the reserves. You  
20 gave us at the bottom of page 7, a figure for the  
21 reserves, Prudhoe Bay, 24 trillion cubic feet. You  
22 didn't give us a figure as regards the delta reserves.  
23 Can you give us a figure that would cover that?

24 A Yes, our estimate of  
25 the delta reserves which we filed with the National  
26 Energy Board, with the Federal Power Commission, in  
27 those proceedings, and I'm not certain whether those  
28 exhibits --

29 MR. GENEST: Well, we've had  
our little arguments about that, Mr. Horte.

A -- filed, and those

V.L. Horte  
In Chief

1 cubic feet at the present time. That is made up of  
2 reserves categorized as proved, probably or possible.  
3 It's our estimate that the reserves that will be  
4 developed in the fields now discovered, having regard  
5 to the seismic of the area, etc., it does not include  
6 simply because of the time at which the work was done,  
7 this winter's drilling, and some new wells that have  
8 been drilled this winter.

9 THE COMMISSIONER: Mr. Horte,  
10 the sizing, the extent of the reserves will have  
11 a bearing on sizing and looping and the life of the  
12 pipeline itself, and you've given us the figure of  
13 6 1/2 trillion. I think I read in the paper that the  
14 president of Alaskan Arctic, your sister company, gave  
15 a figure just very recently, I wish I had the figure  
16 before me, and if the matter is one that doesn't  
17 spring to your mind, I'll try to find it but it seemed  
18 to me to be a much higher figure. You must have been  
19 giving a speech somewhere. Are you aware of the --

20 A I wouldn't think that  
21 with respect to those reserves --

22 Q He was speaking about  
23 Mackenzie Delta.

24 A I suspect he was probably  
25 talking about the estimated potential for that area,  
26 if he gave a much higher figure, and in that regard in  
27 these same exhibits our consultants estimate that the  
28 ultimate reserves that may be developed, in other  
29 words the potential that they foresee in the Mackenzie  
Delta, they foresee it to be well in excess of 50

V.L. Horte  
In Chief

1 trillion cubic feet, that is for the on-shore and  
2 off-shore Beaufort Sea area combined. There are  
3 similar figures on the North Slope of Alaska or the  
4 estimates exceed 100 trillion cubic feet,  
5 estimates have been made by the Geological Survey  
6 in Canada where their estimates, as I recall, are in  
7 the order of 90 to 100 trillion cubic feet in the  
8 Mackenzie Delta and Beaufort Sea areas. So that gives  
9 you the order of magnitude of how people estimate the  
10 potential of the area to be. I would expect it's a figure  
11 such as that, that he must have been mentioning. He  
12 certainly is aware of these numbers, they are in his  
13 own application.

14 Q In your application to  
15 the Minister in March last year, that is to the  
16 Minister of Indian Affairs & Northern Development, did  
17 you give a figure for the reserves, proven reserves  
18 in the delta?

19 A They were filed, sir,  
20 not at that time, but they were filed as I recall about  
21 October or November of 1974. The additional informa-  
22 tion was filed.

23 Q No, I don't mean the  
24 filings, I mean the actual application. I think a figure  
25 of -- well, it can be checked and I don't want to detain  
26 you in giving your evidence in chief, but I think it  
27 was a figure of about -- well, we'll have to look it  
28 up.

29 A I'm not certain, sir. We  
could certainly check that.

V.L. Horte  
In Chief

MR. GEN<sub>EST</sub>: I'll have that  
for you in the morning, sir.

THE COMMISSIONER: Well, I'm  
sure it's on this desk somewhere. Well, carry on,  
sir.

MR. GENEST: Well, sir, if I might be permitted to just follow up on some of your questions. Perhaps it might be useful, certainly it was useful to me to learn about the distinction between proven reserves and probable reserves and estimated reserves.

Q Could you tell us how these are arrived at? They are arrived at on some scientific basis. I understand.

1                   A   When you catagorize  
2 between proved, probably and possible, I guess to some  
3 degree it is a judgment factor just where you draw  
4 the line between <sup>proved</sup>, probable and possible in a  
5 discovered field. -- And I will deal with that  
6 separately. If you go beyond that, when you are dealing  
7 when you are talking about <sup>proved</sup> / , probable and possible,  
8 you are talking about reserves, in a normal sense  
9 of the word, that you believe are associated with  
10 an existing discovery and that is a field or a structure  
11 now discovered and known to contain oil or gas.

12                  When you talk about potential  
13 reserves or ultimate reserves in an area you are  
14 usually talking about somebody's evaluation of what  
15 people are likely to discover when they drill new  
16 structures that have not been explored, the drill has  
17 not penetrated these structures and these evaluations  
18 are made by looking at the overall geology of the  
19 area, the amount of sediments that are likely to be  
20 in the area. The similarity of those sediments to  
21 other known areas in the world where hydrocarbons  
22 have been discovered and the evaluation of the  
23 structures in the area, the likely accumulations and  
24 through this and a great deal of judgement, people  
25 estimate what they think the ultimate potential  
26 will be and certainly they are not always right, because  
27 that is a very inexact science as compared to estimating  
28 the reserves within a field that has been discovered  
29 where you actually have some data and you know that  
30 a hydrocarbon exists.

V.L. Horte

In Chief

Now, in a field where an estimate of the reserves in that field, certainly in the early stages -- let's say that the field has one well in it, he'd be inclined because of lack of additional wells in the structure to estimate the proven reserves based on one well as rather small. However, if he had seismic information which confirmed the existing well and it showed the outline of the structure from seismic that he had confidence in, he would probably extend himself to saying that well, I feel more -- I feel less confident, but still quite confident that probable reserves will extend out to this point in that structure and the possible reserve category is a category where he says, well, I still think there are great possibilities in this structure because of structural outline. They are less certain than the probable category.

Historically, I think this type of evaluation has in general terms demonstrated that with the additional drilling, while they may not outline the particular structure absolutely correctly, that generally the ~~element~~ <sup>Horte</sup> reserves developed in the field follow very closely, not any particular field, but a group of fields to be reserves that really equal the total proved, probable, possible, even though you can't categorize them all as proven at a particular point in time. That is about as far as I can go on that.

MR. GENEST: Thank you. Could I go then, Mr. Horte, to the subject of pipeline

V.L. Horne  
In Chief

1      looping and perhaps we could discuss looping as you have  
2      done in your prepared testimony in general terms, what  
3      is exactly involved and then relate it to this  
4      Mackenzie Valley Pipeline.

5                          A      Yes, sir, well, essentially,  
6      looping is a flexible means of increasing the capacity  
7      of a pipeline. It means adding capacity by laying  
8      an additional segment of pipeline downstream of each  
9      compressor station and tying this segment back  
10     into the existing pipeline. The length of loop  
11    segment is determined by the amount that;you wish to  
12    increase the total throughput. Eventually, as you  
13    continue to increase the capacity of the pipeline by  
14    adding additional segments of loop you will end up  
15    with a duplication of the existing facilities. But  
16    this is done over a period of years and only as  
17    demand and supply demonstrate the feasibility and  
18    desirability of increasing the capacity of the  
19    system.

20                         I would now like to show  
21    a chart which demonstrates this capacity looping  
22    relationship.

23                         MR. GENEST: I have copies  
24    of this, sir, for everybody. It might be given the next  
25    exhibit number.

26    (CHART ENTITLED "EFFECT OF LOOPING AND INCREASING  
27    HORSEPOWER ON GAS DELIVERIES" MARKED EXHIBIT 129)

28                         A      Well, what this chart  
29    depicts is the amount of increased capacity that one  
30    gains with various amounts of looping. Across the bottom ,

V.L. Horte  
IN Chief

1 of the chart is shown the percentage that would be  
2 looped out, that is, the per cent between compressor  
3 stations at anypoint in time and along the left-hand  
4 side of the chart the corresponding percentage increase  
5 in deliveries that this would result in.

6 For example --

7 MR. GENEST: let me just  
8 stop and make sure we all understand this. The bottom  
9 line shows the percentage of additional pipe that you  
10 add.

11 A Yes, sir.

12 Q 100% being a whole new  
13 pipeline.

14 A Whole new pipeline, right,

15 Q And then below that a  
16 segment of pipe that ties back into the main pipe?

17 A Yes, sir, yes.

18 Q And the vertical column  
19 shows what you get by going through that process.

20 A In terms of increased throughput.

21 Q And you have got two  
22 curves. One is keeping the same com -- the first is  
23 with the existing compressor stations, is that right?

24 A That is correct.

25 Q And the next is by adding com-  
26 pression.

27 A yes.

28 Q I am sorry, would you  
29 proceed.

30 Q Well, for example, and let's

ACQUAIRE REPORTING LTD.  
FURNARY 2, B.C.

V.L. HOrte  
In Chief

1 use the lower, the lower chart which is really, the  
2 lower curve which is really the situation that one  
3 is in, when one commences to loop a system,  
4 This depicts our 48" system, proposed 48" system and  
5 shows that that system initially that line shows that  
6 it is powered up with 30,000 Horsepower stations all  
7 the way along the system. It is fully powered and now  
8 we commence to loop the project and just living with  
9 that amount of Horsepower on the system --

10 MR. GENEST: By fully powered,  
11 Mr. -- I am sorry to keep interrupting -- by fully  
12 powered you mean that all the compressor stations that  
13 are planned or that the line will economically handle  
14 have been installed, you are running at maximum  
15 capacity.

16 A It would be operating  
17 at, say, 4-1/2 billion cubic foot a day throughput.  
18 And it is not economic to add additional horsepower,  
19 you really now have to start the looping process.

20 So, looking first at  
21 the bottom of the chart and looking at -- no --  
22 let's start on the left-hand side of the chart. Let's  
23 assume that one wanted to increase the capacity of  
24 the system by 10%. In other words, the reserves were  
25 available to justify this and that markets were available  
26 for that additional quantity of gas. If you move across  
27 from that 10% until one hits the curve, you would  
28 see that you would have to loop about 30% of the system,  
29 30% downstream to each compressor station in order to  
30 gain an increase in capacity of approximately 10%.

ALLWEST REPORTING LTD.  
BURNABY 2, B.C.

V.L. Horte  
In Chief

1 As you go up the curve, let's look at the next  
2 10% increment. If you went now to increase the  
3 capacity by an additional 10% you would find at that  
4 point that the amount of looping required was 55%, so  
5 you can see in this second segment that we talked about  
6 the amount of loop as compared to the first is only  
7 25% more as compared to 30% for the first loop to  
8 obtain the same 10% increase in throughput.

9 You go to the next

10 percentage increase it is a 30% increase, you can see  
11 that a total of something over 70% of the system  
12 would have to be looped, now only a 15% or between  
13 15 and 20% increment on looping to gain this same 10%  
14 increase in capacity and so on as you go up the  
15 curve, where near the latter stages of looping the  
16 percentage increase in capacity gain is much greater  
17 than in the earlier stages of looping.

18 Ultimately, this chart  
19 shows that with only the initial horsepower on the  
20 system and when that system were fully looped out it  
21 would have an increase in its capacity of about 55%.

22

23

24

25

26

27

28

29

30

V.L. Horte  
In Chief

1                     Following this, having looped  
2       the system out, one would then, either then or  
3       possibly earlier, depending on the particular  
4       economic situation that would have to be looked at  
5       at the time, let's assume you looped out first, which  
6       I think is the likely case, you would then commence  
7       to add additional horsepower. You would then commence  
8       to duplicate the horsepower of the existing system  
9       and the effect of that would be, when fully powered  
10      up again in duplicate, to increase the capacity from  
11      55% to 100%, or a 45% gain on the original capacity  
12      of the system; and this again can be done incrementally.  
13      In other words, you can proceed with the horsepower  
14      increment, similarly to what you did with the looping  
15      increment.

16                     Q       Mr. Horte, when you  
17      say "we're adding the horsepower", does this mean  
18      building new compressor stations, or is that done at  
19      the existing compressor stations?

20                     A       It's done on exactly  
21      the same site.

22                     Q       On the same site?

23                     A       Right.

24                     Q       You just add another  
25      compressor.

26                     A       Yes sir, and of course  
27      in the case of this system you would have to add  
28      additional chilling facilities to accompany that  
29      additional compression.

30                     Q       But we're talking now

V.L. Horte  
In Chief

1 about at the same sites.

2 A At the same sites, yes.

3 Now, of course if the demand  
4 for the gas were not there you would have no reason to  
5 expand your facility, and looping would not take  
6 place. In discussing this subject more fully, I'm  
7 going to assume that there is a growing demand for  
8 both delta and Alaskan gas, and I will consider the  
9 constraints imposed by supply.

10 Now pipelines are normally  
11 financed, at least long-distance transmission lines,  
12 on the basis of 20 to 25-year contracts for the sale  
13 of the gas and supply contracts to reasonably assure  
14 these sales over the same period of time. In other  
15 words, to finance the facility, one must have back to  
16 back contracts, you have the supply to increase the  
17 load over that term, you also have to have sales  
18 contracts for the sale of it over that same period.

19 Q But the gas has to be  
20 there with a willing seller.

21 A A willing buyer.

22 Q And there's got to be  
23 a willing buyer at the other end of the pipe.

24 A Yes.

25 Q A:  
26 Right./Now that does  
27 not mean that even initially that you must demonstrate  
28 full deliverability for the whole 20 or 25 years.  
29 This is simply not possible in terms of the economics  
30 of producing fields. In good conventional fields  
field deliveries while you contracted on -- let me go

V.L. Horne  
In Chief

1 back for a second -- a 20-year contract in a field  
2 would be based upon an estimate of the reserves in that  
3 field and the reserves in that field being divided by  
4 20 years, so that the annual contract quantity would be  
5 1/20th of the total reserves known or shown to be avail-  
6 able from a particular field. Now that doesn't give you  
7 the assurance of reserves that they will be deliverable  
8 over that 20-year period. In good conventional  
9 fields, deliveries will be maintained at a constant  
10 level for approximately 12 to 16 years, or roughly 2/3rds  
11 of the life of the reserves. Thereafter the deliver-  
12 ability from the field commences to decline, and the  
13 field will continue to produce over a further period  
14 of 10 to 15 years, in most cases.

15 Q Why does it decline, Mr.  
16 Horne? The pressures aren't there any more?

17 A We are reducing the pressure  
18 of the reservoir as you produce the gas from the field,  
19 you might consider it like a balloon. When you've  
20 pricked a balloon the air comes out very quickly to  
21 begin with, and as you deplete the pressure it comes  
22 out less quickly.

23 During the period of constant  
24 deliveries, pressures in the field decline and result  
25 in lower deliverability from an individual well, for  
26 the reason I've just stated. But this decline is offset  
27 by an infill drilling, in other words you punch more  
28 holes into the balloon, so that while the amount coming  
29 out of any one hole is being reduced, the more holes  
30 you have you would be able to maintain that level of

V.L. Horte  
In Chief

1 delivery from the field as a whole. But there comes a  
2 point where it is not economic to drill more wells  
3 simply for the purpose of maintaining deliverability.  
4 And hence the period of decline. So that while re-  
5 serves are normally sufficient to look after the supply  
6 for a 20 or 25-year period, over which they are con-  
7 tracted for, the physical ability in all cases is  
8 somewhat less in terms of producing those reserves  
9 at a constant rate. This factor is recognized in  
10 the original financing of a project and is taken into  
11 account by assessing the potential of the area and  
12 the likelihood, therefore, of this relatively minor  
13 lack of deliverability in later years being filled in  
14 by future reserves to be discovered.

15 I would like to make the point  
16 that any looping program is only undertaken when  
17 additional reserves have been developed and supply con-  
18 tracts entered into which will support the life of any  
19 new facility in a manner similar to which the original  
20 reserves dedicated to the pipeline were capable of  
21 supporting the original facility. In other words, you  
22 don't increase the capacity of the system unless you  
23 have an increase in reserves to support it. You don't  
24 simply produce the existing reserves at a faster rate  
25 thereby lessening the life of the facility. Over a  
26 period of years, as additional reserves in the area  
27 are developed, and when a decline in deliverability  
28 commences in the reserves initially dedicated to the  
29 project, new additional reserves will have to be  
30 utilized to fill this decline in deliverability.

V.L. Horte  
In Chief

1 Q That decline in deliver-  
2 ability from the original facilities?

3 A Yes sir. Thereby leaving  
4 a lesser amount of any new reserves developed in the  
5 area for expansion or looping of the existing facility.  
6 The choice of whether to expand at a particular moment  
7 in time versus utilizing reserves to maintain deliver-  
8 ability is a question that must be assessed in light of  
9 the then rate of discovery of new reserves in the area  
10 and the potential that still exists for finding further  
11 reserves.

12 You should appreciate that  
13 in the case of any facility expansion these factors  
14 not only are considered by the company involved in the  
15 expansion itself, but their plans and certification  
16 for any new facilities must be approved by the  
17 regulatory body to which they are responsible for any  
18 such expansion. The effect of what I am saying is  
19 that looping should not detract from the ability of the  
20 pipeline to meet its long-term contractual commitments.

21 Q Can I ask you here, Mr.  
22 Horte, again as to whether looping also will shorten  
23 the life of an existing facility?

24 A It will not shorten the  
25 life over which that facility was financed, etc., and  
26 the contracts upon which it was based, and therefore  
27 the service it was intended to perform. You would  
28 have to say this, that if everything else took place,  
29 that the life of -- if you never looped the facility  
30 and somebody were still interested in going out and

V.L. Horte  
In Chief

1 developing new reserves, but waiting 20 years before  
2 they could bring them to market, then in that case  
3 if you never expanded it and you could still get those  
4 reserves, and encourage their development, that the  
5 life of the facility would be longer, if you didn't in  
6 fact loop it.

7 THE COMMISSIONER: And the  
8 cost of the pipeline, having been amortized fully,  
9 the gas would be much cheaper, I guess.

10 A Yes, that's true.

11 MR. GENEST: Now, would you  
12 go on, Mr. Horte, with the question of the proposed  
13 looping of the proposed pipeline?

14 A Well, with respect to the  
15 looping of the pipeline we propose, as you know our  
16 estimate of future reserves development would indicate  
17 that this pipeline might be fully loaded to the 4 1/2  
18 billion cubic foot level by its fifth year of operation,  
19 and therefore any looping would not take place until  
20 after the original capacity of the system was fully  
21 utilized, and then only if additional developments in  
22 the area for the reasons I have outlined justified  
23 such looping. I should add, however, that one -- that  
24 when one looks at the potential of the Mackenzie Delta,  
25 Beaufort area, and the Prudhoe Bay area, as we see it  
26 now, I think it is most likely that this pipeline over  
27 a period of time will be fully looped.

1 MR GENEST: Q Could you |  
2 give us Mr. Horte -- I realize that this depends on a |  
3 very large number of presently unknown factors, but can |  
4 you give us your best present estimate of the range-- |  
5 what you see as the range of timining and the amount |  
6 of looping that might take place.

7 A Well, I would sure |  
8 agree with you that it is a very difficult thing to |  
9 estimate, because there are so many unknowns and variables |  
10 in it. But if you were to look back at this chart |  
11 shown on the screen, a fully looped out system would |  
12 require a volume of gas reserves and a market that |  
13 would support a 55% increase in the original throughput |  
14 of the system.

15 If you are talking about a |  
16 48" system, 55% of that 4 1/2 billion cubic feet a day |  
17 the original capacity, would be in the order of 2 and |  
18 1/2 -- 2 1/4 to 2 1/2 billion cubic feet of gas a day, |  
19 that you would have to see reserves supporting over the |  
20 life of that additional facility.

21 Now, when you look at the |  
22 amount of reserves that would be required to support |  
23 that level of throughput, you are probably talking in the |  
24 order of 18 trillion cubic feet of additional reserves |  
25 required to support that.

26 I think it also likely, as |  
27 indicated by this chart and considering the area one is |  
in, that loops are ikely to be added in increments where |  
you would do a full seasons work in the area while you |  
were there.

Horte  
In Chief

This meaning that you would probably loop this thing out in three increments. And you can see from looking at that chart, that if you did that in equal increments, the first increments where you looped about 30% or slightly in excess would give you an increase in capacity of about 10%. The next increment would increase that to just over 20%, 25% in that area, and the final increment would get you up to the 55%.

Now, this would require as I mentioned in the reserves development within the period of time in which you did this of something in the order of 18 trillion cubic feet. So then one has to look at the question of what is the likely time period over which reserves of that magnitude might be developed in the Mackenzie Delta and on the North Slope of Alaska, if you are combining the two volumes.

I don't think it is unreasonable having regard to the potential of those two areas, particularly when a pipeline facility is in the area, to assume the possibility that those reserves could be developed over a three or four year period, and that therefore this looping could take place over a period of time of three or four years.

THE COMMISSIONER: Beginning in three or four years?

A No, this would be after you had fully loaded the existing facility, and it would once the system were fully powered up.

MR. GENEST: That's five years.

Horte  
In Chief

1 period, in which you would wait for the increments.  
2 Maybe the increments would only be developed every  
3 three years. It's strictly a function of that rate of  
4 development and of course, depending on that rate of  
5 development your assessment as to whether or not looping  
6 in fact is justified in the first instance.

7 I think you would want to  
8 be fairly confident when you started a looping program  
9 that you could expect over a period of time to complete  
10 that looping, even though you weren't assured of it.  
11 You would want to be fairly confident that that would be  
12 the case.

13 Q Well, your first year  
14 of making -- of delivering gas under the existing  
1 proposal is one year before construction actually is  
1 completed, as I recall. Because you will deliver the  
1 Delta gas while you are still building the Prudhoe Bay  
1 supply line, so that there might be--

2 A There would five years--  
3 five operating years, including that as the first year  
4 before you-- based on present prognostications of when  
5 you might have it fully powered. Of course again there  
6 is an unknown with respect to that fully powered system,  
7 and the reserves, the volumes are not there today which  
8 could assure you offfully powering that system.

9 Q Yes. The -- but what  
10 you are saying is that we are looking at three years of  
11 pipe laying, then construction will cease for four years,  
12 and then we might be -- might be looking at three years  
13 of pipe laying again after that.

Horte  
In Chief

A Yes.

Q I just want to make  
sure I understand --

A Yes sir, and between the  
periods of pipe laying the addition of horsepower takes  
place in those intervening years.

Q Yes.

MR. GENEST: We've just got  
a little way to go on looping sir, and then should we  
finish the subject and then break?

THE COMMISSIONER: Yes.

MR. GENEST: Would that  
be satisfactory?

THE COMMISSIONER: Yes,  
certainly.

MR. GENEST: Q Would you  
go on Mr. Horte. You were going to talk about impact  
now.

A Well, the looping of  
the pipeline, if and when it occurs, will, of course,  
involve environmental impact similar to the environmental  
impact of the original line. It will obviously be  
smaller in scale as it is unlikely you would completely  
loop the line in as short a period of time as you  
constructed the original system.

It would be built up in  
increments over a longer period. We would expect the  
impact to be somewhat less than in the original line in  
that logistical facilities will have previously been  
constructed, the same right-of-way would be utilized,

Horte  
In Chief

albeit that this might have to be extended for a distance of 15 to 20 feet and, of course, any compression added in connection with the loop line would be located on the original compressor station pads. Very few, if any, additional operational impacts would occur. I think it is also obvious that further impacts on an area already impacted upon will be of less environmental and sociological significance.

MR. GENEST: That takes us sir to another subject. Would it be convenient to adjourn now.

THE COMMISSIONER: Yes, I think that even though you and Mr. Horte are fresh, the rest of us have been slugging it out here since nine in the morning.

One thing that I just want to leave with counsel. I'm not asking anyone to respond now. What Mr. Horte has said indicates that we have before us a proposal for a-- for the construction of a gas pipeline and the three peak periods of construction are the three winters.

They were discussed Mr. Horte,  
by Mr. Dau and his colleagues, I think it was last week.  
Counsel / might consider whether it would be feasible, since  
if now appears that after a four year hiatus, there would  
be a second construction project lasting three years.  
Counsel might consider whether it would be feasible to  
for evidence to be called at an appropriate stage to  
determine how many construction workers would be involved  
on that project.

Horte  
In Chief

The logistical facilities who would all still be there presumably, the wharves and so forth, and the 400 flatcars that the C.N.R. has ordered.

But we would have, if looping did occur in the way that Mr. Horte has outlined, we would have another three year project, that in many ways that is as vast as the one that is before us.

Well, counsel just might think about that.

MR. GENEST: Well, sir, I  
have thought about that.

THE COMMISSIONER: Well --

MR. GENEST: And I

have some preliminary observations that might be useful for counsel to mull over as well.

THE COMMISSIONER: Yes,

Please tell us.

MR. GENEST: And that is

this, that I think the evidence previous has indicated that additional right-of-way would be required. That an existing application to the Minister is to construct one pipeline, that a fresh application under the Territorial lands Act would have to be made to the Minister for any looping program that would occur.

In addition, /<sup>a</sup> fresh application  
would have to be made, and  
rings, at least under the  
be required to be held.

I should also advise you

1 sir, that we have not had any detailed studies of  
2 any kind with reference to the looping of a pipeline.  
3 We cannot bring forward the kind of evidence that you  
4 have heard in connection with this project, which would  
5 be related to a looping construction program.

6 The technology that would  
7 be involved depending on the time at which any such  
8 looping would occur might be entirely changed.

9 So my preliminary submission  
10 is that it might not be a very useful exercise. I think  
11 it is a factor for everyone to bear in mind when they  
12 are considering the presence of a pipeline here. It  
13 may have socio-economic consequences, some of the bad  
14 ones, some of the good ones. It means a continuing  
15 if you are looking at employment opportunities, it  
16 looks to a renewal of these.

17 But to try and call on  
18 Arctic Gas to produce evidence that would be of much  
19 use to the Inquiry as to the type of logistical programs  
20 that we have, the construction workers that we have,  
21 it would be very difficult for us do so with any degree  
22 of reliability. And perhaps that is something, together  
23 with your comments could be considered by others.

24 THE COMMISSIONER: Yes.

25 Well, thank you Mr. Genest. I've said that all counsel  
26 might consider what I had to say because I didn't  
27 mean to imply that the burden would be entirely thrust  
28 upon Arctic Gas if we were to seek such evidence. That  
29 is not to say though that it would not be thrust upon  
30 you if we were to seek such evidence.

1                   But, you will remember Mr.

2 Dau said that during those three peak years you would  
3 have in the second winter certainly -- you would have  
4 almost 10,000 construction workers, and supervisory  
5 personnel on those spreads.

1                   And you would have many  
2 thousands.. of men on those spreads during the first  
3 and third winters as well.To put it in a fairly blunt way,  
4 if there is a likelihood of all of those construction  
5 workers or their counterparts, assuming they had ..come,  
6 many of them, from the south, returning in four years,  
7 that is something that I think we should bear in mind.  
8 It may be that all we need is the back of an envelope  
9 to get some rough idea of how many construction workers  
10 might be ..returning and really I just wanted all  
11 of you to give some thought to that and when you said,  
12 Mr. Horte, that this estimation of reserves was an  
13 inexact science, I just looked up Mr. Fielder's statement  
14 about Prudhoe Bay reserves, it was a statement that he  
15 made yesterday and he had them at 27 trillion --  
16 3 trillion more than you did, but I am sure --

17                   MR. GENEST: What is a  
18 trillion or two --

19                   THE COMMISSIONER: What is  
20 3 trillion -- Well, we will adjourn until  
21 9 o'clock tomorrow morning.
